# Summary Section

## Investment Objective

ProShares Morningstar Alternatives Solution ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Morningstar® Diversified Alternatives Index<sup>SM</sup> (the “Index”). The Index seeks to provide diversified exposure to alternatives asset classes. The Index consists of a comprehensive set of exchange-traded funds (“ETFs”) in the ProShares lineup that employ alternative and non-traditional strategies such as long/short, market neutral, managed futures, hedge-fund replication, private equity, infrastructure or inflation-related investments. The Index is constructed to enhance risk adjusted portfolio returns when used in combination with traditional investments.

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.07%
Other Expenses	1.11%
Acquired Fund Fees and Expenses*	0.79%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*\* 1.97%  
-1.02%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\* Pursuant to an Expense Limitation Agreement, ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (including Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. ProShare Advisors has also agreed to waive Investment Advisory and Management Services Fees through October 31, 2016. Prior to those dates, ProShare Advisors may not terminate these respective arrangements without the approval of the Fund’s Board of Trustees. Expense waivers/reimbursements (but not Investment Advisory and Management Services Fees waived during the term of the Investment Advisory and Management Services Fee waiver) may be recouped by ProShare Advisors within five years of the end of the Expense Limitation Agreement’s contractual period, to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$519	\$968	\$2,213

The Fund pays transaction costs associated with transacting in securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund (and each Underlying ETF (as defined below) in which the Fund invests) pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover rate for the Fund may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. To the extent an Underlying ETF incurs costs related to portfolio turnover, such costs would have a negative effect on the performance of the Underlying ETF, and thus the Fund, but will not be reflected in the Fund’s portfolio turnover rate. During the period from October 8, 2014 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 34% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund is a fund of ETFs and seeks to achieve its investment objective by investing primarily in the Underlying ETFs, each of which is a ProShares ETF.

The Fund is designed to provide investors with a comprehensive solution to their alternatives allocation by investing in the alternative ETFs (i.e., ETFs that invest in alternative asset classes or that have non-traditional investment strategies) comprising its index. The Index is designed to provide diversified exposure to alternative asset classes in order to enhance risk adjusted portfolio returns when combined with a range of traditional investments. It allocates among a comprehensive set of alternative ETFs that employ alternative and non-traditional strategies such as long/short, market neutral, managed futures, hedge fund replication, private equity, infrastructure or inflation-related investments.

The Index allocates to the Underlying ETFs based on a proprietary optimization model – which annually calculates the allocation to each Underlying ETF based on the improvement in portfolio risk/return characteristics each Underlying ETF provides to a traditional stock and bond portfolio. In addition, at each monthly rebalance, the Index applies a tactical momentum signal

designed to increase the allocations towards asset classes that exhibit positive relative trends over the prior six months.

As of June 30, 2015, the Underlying ETFs included: ProShares Managed Futures Strategy, ProShares Hedge Replication ETF, ProShares Merger ETF, ProShares RAFI Long/Short, ProShares Global Listed Private Equity ETF, ProShares DJ Brookfield Global Infrastructure ETF, and ProShares 30 Year TIPS/TSY Spread. A brief description of each of these Underlying ETFs follows.

*ProShares Managed Futures Strategy (FUTS)* seeks to provide investment results that generally correspond (before fees and expenses) to the performance of the S&P Strategic Futures Index. The S&P Strategic Futures Index was developed by Standard & Poor's and is a long/short rules-based investable index that seeks to capture the economic benefit derived from both rising and declining trends in futures prices.

*ProShares Hedge Replication ETF (HDG)* seeks investment results, before fees and expenses, that track the performance of the Merrill Lynch Factor Model – Exchange Series ("Factor Model"). The Factor Model, established by Merrill Lynch International, seeks to provide the risk and return characteristics of the hedge fund asset class by targeting a high correlation to the HFRI Fund Weighted Composite Index (the "HFRI").

*ProShares Merger ETF (MRGR)* seeks investment results, before fees and expenses that track the performance of the S&P Merger Arbitrage Index. The index is designed to provide exposure to a global merger arbitrage strategy.

*ProShares RAFI™ Long/Short (RALS)* seeks investment results, before fees and expenses, that track the performance of the RAFI™ US Equity Long/Short Index. The index methodology seeks to capitalize on a theory that traditional index weighting based on market capitalization results in overweighting of overpriced securities and underweighting of underpriced securities.

*ProShares Global Listed Private Equity ETF (PEX)* seeks investment results, before fees and expenses, that track the performance of the LPX Direct Listed Private Equity Index. The index consists of up to 30 qualifying listed private equity companies whose direct private equity investments, as well as cash and cash equivalent positions and post-initial public offering listed investments, represent more than 80% of the total assets of the company.

*ProShares DJ Brookfield Global Infrastructure ETF (TOLZ)* seeks investment results, before fees and expenses, that track the performance of the Dow Jones Brookfield Global Infrastructure Composite Index. The index, constructed and maintained by S&P Dow Jones Indices LLC, consists of companies domiciled globally that qualify as "pure-play" infrastructure companies—companies whose primary business is the ownership and operation of infrastructure assets, activities that generally generate long-term stable cash flows.

*ProShares 30 Year TIPS/TSY Spread (RINF)* seeks investment results, before fees and expenses, that track the

performance of the Credit Suisse 30-Year Inflation Break-even Index (the "Breakeven Index"). The index tracks the performance of long positions in the most recently issued 30-year Treasury Inflation-Protected Securities ("TIPS") bond and duration-adjusted short positions in U.S. Treasury bonds of the closest maturity. The difference in yield (or "spread") between these bonds (Treasury yield minus TIPS yield) is commonly referred to as a "breakeven rate of inflation" ("BEI"). The 30-Year BEI is considered to be a measure of the market's expectations for inflation over the next thirty years.

For a more detailed description of the Underlying ETFs, please see "The Underlying ETFs" in the back of the Fund's Full Prospectus.

The Index is constructed and maintained by Morningstar, Inc., using the asset allocation expertise of its affiliate, Ibbotson Associates, Inc., a division of Morningstar Investment Management. The Index is published under the Bloomberg ticker symbol "DIVALT."

"Underlying ETFs" are ETFs, sponsored by the Advisor or its affiliates, in which the Fund invests. In addition to ETFs that are investment companies registered under the Investment Company Act of 1940, as amended ("1940 Act"), one of the Underlying ETFs currently included in the Index is an ETF that is not a mutual fund or any other type of investment company as defined in the 1940 Act and is not subject to regulation thereunder.

For a further description of the Index, please see "Description of the Index" in the back of the Fund's Full Prospectus.

The Fund invests in ETFs that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in Underlying ETFs.

The securities that the Fund will principally invest in are set forth below.

- **Exchange-Traded Funds (ETFs)** – The Fund invests in shares of other ETFs, which are listed, open-ended pooled investment entities that provide exposure to different asset classes and investment strategies.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index, holding each security in approximately the same proportion as its weighting in the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors' view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry, group of industries, country or region to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

**You could lose money by investing in the Fund.**

### Principal Risks Related to the Fund

- **Affiliated Fund Risk** – The Fund invests exclusively in Underlying ETFs that are affiliated with ProShare Advisors. The use of affiliated Underlying ETFs may subject ProShare Advisors to potential conflicts of interest; for example, the fees paid to ProShare Advisors by certain Underlying ETFs may be higher than on other Underlying ETFs. If an Underlying ETF holds interests in another affiliated ETF, the Fund may be prohibited from purchasing shares of that Underlying ETF.
- **Investment Strategy Risk** – There is no guarantee that the Fund will produce high or even positive returns, or that it will enhance risk adjusted portfolio returns when combined with traditional investments. The Index allocates to the Underlying ETFs based in large part on the historical performance and other related characteristics of the individual Underlying ETFs, their benchmarks, and the asset classes they represent. There is no guarantee that the Underlying ETFs will continue to perform as they have in the past or as they are expected to perform in the future, or that the Underlying ETFs will meet their investment objectives. Furthermore, the quantitative allocation strategy utilized by the Index may allocate to the Underlying ETFs in a way that proves to be sub-optimal for a given market environment.
- **Correlation Risk** – There is no guarantee that the Fund or any Underlying ETF will achieve a high degree of correlation with its index, which may hinder its ability to meet its investment objective.
- **Commodity and Currency Risk** – Investments linked to commodity or currency futures contracts can be highly volatile compared to investments in traditional securities and funds holding instruments linked to commodity or currency futures contracts may experience large losses. The value of instruments linked to commodity or currency futures contracts may be affected by changes in overall market movements, commodity or currency benchmarks (as the case may be), volatility, changes in interest rates, or factors affecting a particular industry, commodity or currency. For example, commodity futures contracts may be affected by numerous factors, including drought, floods, fires, weather, livestock disease, pipeline ruptures or spills, embargoes, tariffs and international, economic, political or regulatory developments. In particular, trading in natural gas futures contracts (or other financial instruments linked to natural gas) has been very volatile and can be expected to be very volatile in the future. High volatility may have an adverse impact on certain Underlying ETFs beyond the impact of any performance-based losses of the underlying indexes.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund or an Underlying ETF being unable to buy or sell certain securities. In these circumstances, the Fund or an Underlying ETF may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Investment in Underlying ETFs Risk** – The Fund expects to invest substantially all of its assets in the Underlying ETFs, so the Fund’s investment performance is directly related to the investment performance of the Underlying ETFs. An investment in the Fund is subject to the risks associated with the Underlying ETFs that comprise the Index. The Fund’s NAV will change with changes in the value of the Underlying ETFs in which the Fund invests. As the Underlying ETFs, or the Fund’s allocations among the Underlying ETFs, change from time to time, or to the extent that the expense ratio of the Underlying ETFs changes, the weighted average operating expenses borne by the Fund may increase or decrease. An investment in the Fund will entail more direct and indirect costs and expenses than a direct investment in the Underlying ETFs. For example, the Fund indirectly pays not only a portion of the expenses (including operating expenses and management fees) incurred by the Underlying ETFs, but its own expenses as well. One Underlying ETF may buy the same securities that another Underlying ETF sells. Also, taxable distributions made by the Underlying ETFs could cause the Fund to make a taxable distribution to its shareholders.

The value of the Fund’s investment in Underlying ETFs is generally based on secondary market prices and, as such, the Fund may suffer losses due to developments in the security markets, the failure of an active trading market to develop, trading halts or de-listings.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the benchmark. Furthermore, the Underlying ETFs in which the Fund invests may have varying degrees of liquidity and associated spreads. Lower liquidity and wider spreads have a negative impact on the Fund’s performance.
- **Market Price Variance Risk** – Individual shares of the Fund are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of

shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. While the creation/redemption feature is designed to make it likely that shares normally will trade close to the value of the Fund's holdings, disruptions to creations and redemptions may result in trading prices that differ significantly from the value of the Fund's holdings. Shares may trade at a discount to the value of the Fund's holdings, and the discount is likely to be greatest when the price of shares is falling fastest, which may be the time that you most want to sell your shares. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming shares directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the 1940 Act, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's or the Underlying Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Tax Risk** – The Fund's ability to pursue its investment strategies may be limited by the Fund's intention to qualify as a regulated investment company for tax purposes, and may bear adversely on the Fund's ability to so qualify. For these purposes, the Fund is limited to investing no more than 25% of the value of its total assets in securities of one or more “qualified publicly traded partnerships” (QPTPs). If the Fund does not appropriately limit such investment, the Fund's status as a regulated investment company will be jeopardized. If, in any year, the Fund were to fail to qualify as a regulated investment company, the Fund would be taxed as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce the Fund's net assets and the amount of income available for distribution.
- **Valuation Risk** – In certain circumstances, Underlying ETFs may be valued using techniques other than market quotations. The value established for an Underlying ETF may be different from

what would be produced through the use of another methodology or if it had been priced using market quotations. Underlying ETFs that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell an Underlying ETF for the value established for it at any time, and it is possible that the Fund would incur a loss because an Underlying ETF is sold at a discount to its established value.

## Risks Related to the Underlying ETFs

The Fund is subject to the risks of the Underlying ETFs to the extent it allocates to the relevant Underlying ETFs. Investments in the Underlying ETFs may subject the Fund to the following risks:

- **Benchmark/Index Performance Risk** – There is no guarantee or assurance that the methodology used to create the Index, or a benchmark or index for a particular Underlying ETF, will result in the Fund or an Underlying ETF, as applicable, achieving high, or even positive, returns. The Index or benchmark for a particular Underlying ETF may underperform more traditional indices. In turn, the Fund or an Underlying ETF could lose value while the levels of other indices or measures of market performance increase.
- In addition, the Merrill Lynch Factor Model–Exchange Series, the benchmark for ProShares Hedge Replication ETF (an Underlying ETF), does not in any way represent a managed hedge fund or group of hedge funds, and there is no guarantee that it will achieve returns correlated with any hedge fund, group of hedge funds, or the HFRI Fund Weighted Composite Index (the “HFRI”) (an index that the Merrill Lynch Factor Model–Exchange Series is designed to correlate to). Neither ProShare Advisors nor Merrill Lynch International has any control over the composition or compilation of the HFRI, and there is no guarantee that the HFRI will continue to be produced.
- **Breakeven Inflation Investing Risk** – ProShares 30 Year TIPS/TSY Spread seeks investment results, before fees and expenses, that track the Breakeven Index. The Breakeven Index tracks the performance of long positions in the most recently issued 30-year Treasury Inflation-Protected Securities (TIPS) bond and duration-adjusted short positions in U.S. Treasury bonds of the closest maturity. The difference in yield (or spread) between these bonds (Treasury yield minus TIPS yield) is commonly referred to as a “breakeven rate of inflation” (BEI) and is considered to be a measure of the market's expectations for inflation over the relevant period. The level of the Breakeven Index (and the fund) will fluctuate based on changes in the value of the underlying bonds, which will likely not be the same on a percentage basis as changes in the BEI. The Breakeven Index is not designed to measure or predict the realized rate of inflation, nor does it seek to replicate the returns of any price index or measure of actual consumer price levels. Changes in the BEI are based on the TIPS and U.S. Treasury markets, interest rate and inflation expectations, and fiscal and monetary policy.

There is no guarantee that these factors will combine to produce any particular directional changes in the Breakeven Index over time, or that the fund will retain any appreciation in value over extended periods of time, or that the returns of the Breakeven Index or the fund will track or outpace the realized rate of inflation, or any price index or measure of actual consumer price levels. It is possible that the returns of the Breakeven Index or the fund will not correlate to (or may be the opposite of) the change in the realized rate of inflation, or any price index, or measure of actual consumer price levels. Furthermore, while the BEI provides exposure to inflation expectations, it may also be influenced by other factors, including premiums related to liquidity for certain bonds as well as premiums surrounding the uncertainty of future inflation. These other factors may impact the level of the Breakeven Index or the value of the fund in unexpected ways and may cancel out or even reverse the impact of changes in inflation expectations. As a result, an investment in the fund may not serve as an effective hedge against inflation.

- **Counterparty Risk** – Certain Underlying ETFs will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount such Underlying ETF expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Underlying ETF. An Underlying ETF may be negatively impacted if a counterparty becomes bankrupt or otherwise fails to perform its obligations under such an agreement, or if any collateral posted by the counterparty for the benefit of the Underlying ETF is insufficient or there are delays in the Underlying ETF's ability to access such collateral.
- **Debt Instrument Risk** – Debt instruments may have varying levels of sensitivity to changes in interest rates, issuer credit risk, and are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the fixed income market. Typically, the value of outstanding debt instruments falls when interest rates rise.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the underlying index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in an Underlying ETF to decrease.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in an Underlying ETF to decrease. Further, fixed income securities in the underlying index may underperform other fixed income investments that track other markets, segments and sectors.
- **Foreign Currency Risk/Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus similar investments that do not have foreign currency exposure. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in Depositary Receipts or ordinary shares of foreign issuers traded on U.S. exchanges or an investment in an instrument linked to a foreign currency is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, certain Underlying ETFs may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings. In certain "restricted market" countries (which limit the ability of non-nationals to transact in those countries' currencies), the Underlying ETF will be limited in its ability to use multiple dealers to obtain exchange rates. This may result in potentially higher costs for the Underlying ETF, and increased correlation risk. Further, the limitation on dealers may cause delays in execution, which may also increase correlation risk.
- **Foreign Investments Risk/Exposure to Foreign Investments Risk** – Foreign markets, particularly emerging markets, can be less liquid, more volatile and significantly smaller than the U.S. market due to increased risks of adverse issuer, political, regulatory, market, or economic developments, and can perform differently from the U.S. market. In many foreign countries, there is less publicly available information about issuers; less government supervision and regulation of investments; and different accounting, auditing and financial reporting standards. An Underlying ETF may experience difficulties or be unable to pursue legal remedies and obtain judgments in foreign courts. Emerging markets can be subject to greater social, economic, regulatory, regional, and political uncertainties and can be extremely volatile. Foreign currency exchange rates also can be extremely volatile.

- **Geographic Concentration Risk** – Underlying ETFs that focus their investments in particular foreign countries or geographic regions, may be more volatile than more geographically diversified funds. The performance of these Underlying ETFs will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks or debt issued by companies in European Countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, which may negatively impact the Underlying ETF's returns.
- **Infrastructure Industry Risk** – ProShares DJ Brookfield Global Infrastructure ETF is subject to risks faced by companies in the infrastructure industry to the same extent as its index is so concentrated, including: potential limitation of usage rates by governmental regulatory commissions, changes in the nature of a government concession that may negatively impact a company; special tariffs that are imposed or changes in tax laws; revenue that is significantly lower than projected and/or cost overruns; increases to operating costs; increases to interest rates that may affect the average cost of funding; changes in supply and demand; deregulation, which may subject companies to greater competition; and government intervention or other factors that may render a company's equipment unusable or obsolete and negatively impact profitability. Other infrastructure industry risks include natural disasters, environmental liabilities due to a company's operations or an accident or other general civil liabilities, changes in market sentiment toward infrastructure and terrorist attacks.
- **Long/Short Risk** – Certain Underlying ETFs seek both long and short exposure. There is no guarantee that the returns on the Underlying ETFs' long or short positions will produce high, or even positive, returns and the Underlying ETFs could lose money if either or both the Underlying ETFs' long and short positions produce negative returns. As a result, such investments may give rise to losses that exceed the amount invested in those assets.
- **Risks Associated with the Use of Derivatives** – Certain Underlying ETFs may obtain investment exposure through derivatives (including investing in swap agreements, futures contracts, options on futures contracts, securities and indexes, forward contracts and similar instruments). Investing in derivatives may be considered aggressive and may expose the Underlying ETF to greater risks than investing directly in the reference asset(s) underlying those derivatives (e.g., the securities contained in an Underlying ETF's index). When an Underlying ETF uses derivatives, there may be imperfect correlation between the value of the reference asset(s) underlying the derivative (e.g., the securities in the index) and the derivative, which may prevent the Underlying ETF from achieving its investment

objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Underlying ETF to losses in excess of those amounts initially invested.

Moreover, with respect to the use of swap agreements, if an index has a dramatic intraday move that causes a material decline in an Underlying ETF's net assets, the terms of a swap agreement between the Underlying ETF and its counterparty may permit the counterparty to immediately close out the transaction with the Underlying ETF. In that event, the Underlying ETF may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Underlying ETF's investment objective. This, in turn, may prevent the Underlying ETF from achieving its investment objective, even if the index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Underlying ETF's return.

- **Risks Related to a Managed Futures Strategy** – ProShares Managed Futures Strategy utilizes an index that is based on a quantitative trading strategy. As market dynamics shift over time, this strategy may not continue to perform as anticipated. The index takes long or short positions based on the performance trends of the individual components. There can be no assurance that such trends are an accurate indicator of future market movements. In markets without sustained price trends, or markets with significant price movements that quickly reverse, the Underlying ETF may suffer significant losses. The Underlying ETF's index is based on futures prices, not spot prices. Futures can perform very differently from spot prices. This Underlying ETF's exposure to commodity or financial futures markets may subject it to greater volatility than investments in traditional securities, which may adversely affect an investor's investment in that Underlying ETF. Certain index components of that Underlying ETF have experienced high volatility in the past.

Certain of these futures contracts are subject to risks related to rolling, which is the process in which an Underlying ETF closes out and replaces futures contracts that near expiration with futures contracts with a later expiration.

The prices at which the Underlying ETF can replace expiring commodity futures contracts or financial futures contracts may be higher or lower in the nearer months than in the more distant months. The pattern of higher futures prices for longer expiration futures contracts is often referred to as "contango." The pattern of higher futures prices for shorter expiration futures contracts is referred to as "backwardation." There have been extended periods in which contango or backwardation has existed in the futures contract markets for various types of futures contracts, and such periods can be expected to occur in the future. The presence of contango in certain commodity futures contracts or financial futures contracts at the time of rolling would be expected to adversely affect long positions held by the Underlying ETF and positively affect short positions held by the Underlying ETF. Similarly, the presence of backwardation in certain commodity futures contracts or financial futures contracts at the time of rolling such contracts

would be expected to adversely affect short positions held by the Underlying ETF and positively affect long positions held by the Underlying ETF.

- **Risks Related to a Merger Arbitrage Strategy** – A global merger arbitrage strategy seeks to capture the spread between the price at which the stock of a company (each such company, a “Target”) trades after a proposed acquisition of such Target is announced and the value (cash plus stock) that the acquiring company (the “Acquirer”) has proposed to pay for the stock of the Target (a “Spread”). Such a Spread typically exists due to the uncertainty that the announced merger, acquisition or other corporate reorganization (each, a “Deal”) will close, and if it closes, that such Deal will be at the initially proposed economic terms. There is no assurance that any of the Deals reflected in this Underlying ETF will be successfully completed. In particular, in certain market conditions, it is possible that most or all of the Deals could fail. If any Deal reflected in this Underlying ETF is not consummated, the Spread between the price offered for the Target and the price at which the shares of the Target trade is expected to widen. In such cases the price of the Target commonly falls back to pre-Deal announcement levels, typically resulting in significant losses well in excess of the post-announcement Spread the strategy attempts to capture. This could adversely affect the performance of this Underlying ETF and the performance of the Fund. Deals may be terminated, renegotiated, or subject to a longer time frame than initially contemplated due to business, regulatory, or other concerns. Any of these events may negatively impact the performance of this Underlying ETF. This Underlying ETF may also delete transactions under certain circumstances, thus precluding any potential future gains. Also, foreign companies involved in pending mergers or acquisitions may present risks distinct from comparable transactions completed solely within the U.S.

Furthermore, the Merger Arbitrage Strategy seeks to hedge its exposure to foreign currencies. These hedges will in many cases not fully eliminate the exposure to a particular currency. In addition, interest rate differentials and additional transaction costs can diminish the effectiveness of a particular hedging position. All of these factors may cause additional risk.

- **Risks Relating to Investing in Listed Private Equity Companies** – ProShares Global Listed Private Equity ETF may be subject to risks faced by companies in the private equity sector to the same extent as its index is so concentrated, in particular the skill of such companies in selecting underlying investments. There are certain risks inherent in investing in listed private equity companies, which encompass business development companies (BDCs) and other financial institutions or vehicles whose principal business is to invest in and provide mezzanine financing to privately held companies.

Generally, little public information exists for private and thinly traded companies, and there is a risk that investors may not be able to make a fully informed investment decision. Private equity securities additionally carry other risks including those related to unclear ownership, market access constraints and market opaqueness. In addition, at times, a private equity company may hold a significant portion of its assets in cash or

cash equivalents (e.g., after divesting itself of its interests in a portfolio company upon the portfolio company’s IPO, merger or recapitalization). This may result in lower returns than if the private equity company had invested such cash or cash equivalents in successful portfolio companies.

Furthermore, investments in listed private equity companies may include investments in BDCs. BDCs are special investment vehicles designed to facilitate capital formation for small and middle-market companies. BDCs are registered under the 1940 Act, but may be exempt from many of its regulatory constraints provided that they comply with certain investment guidelines. BDCs may carry additional risks such as limited investment opportunities, uncertainties surrounding valuation, leverage and management risk.

- **Risks Related to Investing in Qualified Publicly Traded Partnerships** – The treatment of ProShares Managed Futures Strategy (FUTS) as a “qualified publicly traded partnership” (QTP) for federal income tax purposes is uncertain and may vary year by year. If, in any taxable year of FUTS it were not to be a QTP, it would be treated for federal income tax purposes as either a “regular” partnership, in which case the gross income, gains, losses, deductions, credits, and other tax items of FUTS would generally be allocated to the Fund, or as a corporation, in the latter case subjecting FUTS to U.S. federal income tax on all its income. The resulting taxes could substantially reduce the Fund’s return on its investment in FUTS.

In years in which FUTS is a QTP, the Fund’s investment in FUTS may be limited by the Fund’s intention to qualify as a regulated investment company for tax purposes, and may bear adversely on the Fund’s ability to so qualify. For these purposes, the Fund is limited to investing no more than 25% of the value of its total assets in securities of one or more qualified QTPs. If the Fund does not appropriately limit such investments when FUTS is a QTP, the Fund’s status as a regulated investment company will be jeopardized.

ProShares DJ Brookfield Global Infrastructure ETF (TOLZ) invests in Master Limited Partnerships (MLPs) that are treated as QTPs for federal income tax purposes and those investments may be limited by its intention to qualify as a regulated investment company for tax purposes, and may bear adversely on its ability to so qualify. For these purposes, TOLZ is limited to investing no more than 25% of the value of its total assets in one or more QTPs. If TOLZ does not appropriately limit such investments, its status as a regulated investment company will be jeopardized. If, in any year, TOLZ were to fail to qualify as a regulated investment company, TOLZ would be subject to U.S. federal income tax on all its income, which could substantially reduce the Fund’s return on its investment in TOLZ. In addition, such failure could jeopardize the Fund’s status as a regulated investment company.

If, in any year, the Fund were to fail to qualify as a regulated investment company, the Fund would be taxed as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce the Fund’s net assets and the amount of income available for distribution.

- **Risks Relating to Restrictions on Investment Company Investments** – Certain Underlying ETFs that invest in BDCs or other investment companies may not acquire greater than three percent (3%) of the total outstanding shares of such companies. As a result, the ability of such Underlying ETFs to purchase certain of the securities as dictated by their strategy could be limited. In these circumstances, such Underlying ETF may be required to use sampling techniques, which could increase “Correlation Risk”, as described above.
- **Short Sale Exposure Risk** – Certain Underlying ETFs may seek inverse or “short” exposure, which may cause them to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Underlying ETF’s return or result in a loss. To the extent that, at any particular point in time, the securities underlying the short position may be thinly-traded or have a limited market, including due to regulatory action, an Underlying ETF may be unable to meet its investment objective (e.g., due to a lack of available securities or counterparties). During such periods, the Underlying ETF’s ability to issue additional Creation Units may be adversely affected. Any income, dividends or payments by the assets underlying the Underlying ETF’s short positions will negatively impact the Underlying ETF.
- **Small- and Mid-Cap Company Investment Risk** – Underlying ETFs may have exposure to the stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Each of Underlying ETFs is also subject to the following risks described above under the caption “Principal Risks Related to the Fund”: Correlation Risk, Early Close/Late Close/Trading Halt Risk, Liquidity Risk, Market Price Variance Risk, Portfolio Turnover Risk and Valuation Risk.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.

### Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2014.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 10,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares DJ Brookfield Global Infrastructure ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Dow Jones Brookfield Global Infrastructure Composite Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.45%
Other Expenses	0.76%
Acquired Fund Fees and Expenses*	0.01%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**1.22%**

Fee Waiver/Reimbursement\*\*

**-0.76%**

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.46%**

\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.45% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$47	\$312	\$597	\$1,410

The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 11% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index, constructed and maintained by S&P Dow Jones Indices LLC, consists of companies domiciled globally that qualify as “pure-play” infrastructure companies—companies whose primary business is the ownership and operation of infrastructure assets, activities that generally generate long-term stable cash flows.

Eligible companies must have more than 70% of cash flows derived from the following infrastructure assets (exclusive of cash flow from infrastructure-related businesses, such as energy exploration and generation): Airports; Toll Roads; Ports; Communications; Electricity Transmission & Distribution; Oil & Gas Storage & Transportation; Water; or Diversified (multiple infrastructure assets). Additionally, companies must meet minimum market capitalization and trading volume requirements.

Index weights are based on a modified free-float adjusted market capitalization methodology.

The Index is reconstituted and rebalanced quarterly in March, June, September and December. The Index is published under the Bloomberg ticker symbol “DJBGICUT.”

For a further description of the Index, please see “Description of the Index” in the back of the Fund’s Full Prospectus.

The Fund invests in securities that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in common stock issued by U.S. and foreign public companies, including Master Limited Partnerships (MLPs), which are commonly taxed as partnerships and publicly traded on national securities exchanges. The Fund generally does not intend to invest more than 25% of its total assets in MLPs.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index. The Fund may invest in only a representative sample of the securities in the Index and may overweight or underweight securities of the Index in relation to their composition in the Index, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not

invest the assets of the Fund in securities based on ProShare Advisors' view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis. In addition, ProShare Advisors does not forecast market movement or trends, in managing the assets of the Fund.

The Fund seeks to remain fully invested at all times in securities that provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry, group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the oil and gas storage and transportation industry group.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the change in the performance of the Fund and change in the level of the Index on such day. Furthermore, the Fund's currency holdings may be valued at a different time than the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- Oil, Gas & Consumable Fuels Industry Risk** – The Fund is subject to risks faced by companies in the oil, gas and consumable fuels industry sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where oil, gas and consumable fuels companies are located or do business; and risk for environmental damage claims. The oil, gas and consumable fuels industry is also affected by risks that affect the narrower oil equipment, services and distribution sector, including: securities prices that may be very volatile, particularly when products are up for regulatory approval; and lower demand for oil-related products due to changes in consumer demands, warmer winters and energy efficiency.
- Foreign Currency Risk** – Certain of the Fund's investments may be linked to or denominated in foreign currencies. Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment denominated in a foreign currency, like certain of the investments included in the Index, is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings.
- Foreign Investments/Emerging Market Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index's performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to purchase or

sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Energy Industry Risk** – The Fund is subject to risks faced by companies in the energy sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where energy companies are located or do business; and risk for environmental damage claims.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or adverse market developments may cause the value of an investment in the Fund to decrease.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating

downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks issued by companies in European Countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, which may negatively impact the Fund's returns.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their local market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Master Limited Partnership Risk** – The Fund may invest in Master Limited Partnerships (MLPs), which are commonly taxed as partnerships and publicly traded on national securities exchanges. Investments in common units of MLPs involve risks that differ from investments in common stock, including risks related to limited control and limited rights to vote on matters that affect the MLP. MLPs are commonly treated as partnerships that are “qualified publicly traded partnerships” (QPTPs) for federal income tax purposes, which commonly pertain to the use of natural resources. Changes in U.S. tax laws could revoke the pass-through attributes that provide the tax efficiencies that make MLPs attractive investment structures.
  - **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund’s investment exposure. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
  - **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
  - **Tax Risk** – The Fund’s investments in MLPs that are treated as “qualified publicly traded partnerships” (QPTPs) for federal income tax purposes may be limited by the Fund’s intention to qualify as a regulated investment company for tax purposes, and may bear adversely on the Fund’s ability to so qualify. For these purposes, the Fund is limited to investing no more than 25% of the value of its total assets in securities of one or more QPTPs. If the Fund does not appropriately limit such investments or if such investments are recharacterized for federal income tax purposes, the Fund’s status as a regulated investment company may be jeopardized. If, in any year, the Fund were to fail to qualify as a regulated investment company, the Fund would be taxed as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce the Fund’s net assets and the amount of income available for distribution.
  - **Utilities Industry Risk** – The Fund is subject to risks faced by companies in the utilities economic sector to the same extent as the Index is so concentrated, including: review and limitation of rates by governmental regulatory commissions; the fact that the value of regulated utility instruments tends to have an inverse relationship to the movement of interest rates; the risk that utilities may engage in riskier ventures where they have little or no experience, as deregulation allows utilities to diversify outside of their original geographic regions and their traditional lines of business and greater competition as a result of deregulation, which may adversely affect profitability due to lower operating margins, higher costs and diversification into unprofitable business lines.
  - **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.
- ### Investment Results
- Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.
- ### Management
- The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since March 2014.
- ### Purchase and Sale of Fund Shares
- The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).
- ### Tax Information
- Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares Global Listed Private Equity ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the LPX Direct Listed Private Equity Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.50%
Other Expenses	1.43%
Acquired Fund Fees and Expenses*	2.38%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>4.31%</b>
Fee Waiver/Reimbursement**	-1.33%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>2.98%</b>
--	--------------

\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\*ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (excluding Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.60% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$301	\$1,187	\$2,084	\$4,383

The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage

commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 18% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index, published by LPX AG (“LPX”), consists of up to 30 qualifying listed private equity companies. A listed private equity company is an eligible candidate for the Index if its direct private equity investments, as well as cash and cash equivalent positions and post-initial public offering listed investments, represent more than 80% of the total assets of the company. LPX considers direct private equity investments to be direct investments noted on the balance sheet of the listed private equity company in the equity, mezzanine or debt facility of an underlying private company or investments in limited partnerships managed by the management portion of the listed private equity company. Each candidate for the Index will have a majority of its assets invested in or exposed to private companies or have a stated intention to have a majority of its assets invested in or exposed to private companies.

The Index applies a liquidity screen to qualifying companies and then includes up to 30 of the remaining companies based, among other things, on greater relative trading volume (i.e. trading volume relative to the market capitalization of the company)—the Index historically has included securities of all market capitalizations, from micro- to large-cap. The Index is reconstituted quarterly and is published under the Bloomberg ticker symbol “LPXDITU”.

For a further description of the Index, please see “Additional Information on Certain Underlying Indexes” in the back of the Fund’s Full Prospectus.

The Fund invests in securities that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index). The securities that the Fund will principally invest in are set forth below

- **Equity Securities** – The Fund invests in common stock issued by U.S. and foreign public companies, including in large part business development companies (BDCs) for U.S. domiciled companies. BDCs are specialized investment vehicles that provide financing to small- and middle-market companies and offer managerial expertise, as needed, to assist those companies.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors' view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in the United Kingdom.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index, include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Furthermore, the Fund's currency holdings may be valued at a different time than the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.

- **Risks Relating to Investing in Listed Private Equity Companies** – The Fund is subject to risks faced by companies in the private equity sector to the same extent as the Index is so concentrated, in particular the skill of such companies in selecting underlying investments. There are certain risks inherent in investing in listed private equity companies, which encompass business development companies (BDCs) and other financial institutions or vehicles whose principal business is to invest in and provide mezzanine financing to privately held companies. Generally, little public information exists for private and thinly traded companies, and there is a risk that investors may not be able to make a fully informed investment decision. Private equity securities additionally carry other risks including those related to unclear ownership, market access constraints and market opaqueness. In addition, at times, a private equity company may hold a significant portion of its assets in cash or cash equivalents (e.g., after divesting itself of its interests in a portfolio company upon the portfolio company's IPO, merger or recapitalization). This may result in lower returns than if the private equity company had invested such cash or cash equivalents in successful portfolio companies.
- **Risks Relating to Investing in Business Development Companies (BDCs)** – BDCs are special investment vehicles designed to facilitate capital formation for small and middle-market companies. BDCs are closed-end investment companies subject to the Investment Company Act of 1940 (the "1940 Act"); however, BDCs are exempt from many of the regulatory constraints imposed by the 1940 Act. A BDC is a domestic company that (1) operates for the purpose of making investments in certain securities and, with limited exceptions, makes available "significant managerial assistance" with respect to the issuers of such securities, and (2) has elected business development company status. As a general matter, a BDC must maintain at least 70% of its investments in certain types of eligible portfolio companies that do not have securities listed on a national securities exchange or that have less than \$250 million in aggregate market value. The Fund is subject to risks faced by BDCs to the same extent as the Index is so concentrated, including: increasing competition for limited BDC investment opportunities; potential uncertainty as to the value of a BDC's private investments; risks associated with leverage; and reliance on a BDC's managerial acumen.
- **Risks Relating to Restrictions on Investment Company Investments** – A significant portion of the Index is composed of BDCs or other investment companies. The Fund may not acquire greater than three percent (3%) of the total outstanding shares of such companies. As a result, the Fund's ability to purchase certain of the securities in the Index in the proportions represented in the Index could be inhibited. In these circumstances, the Fund may be required to use sampling techniques, which could increase "Correlation Risk", as described above.
- **Foreign Currency Risk** – Certain of the Fund's investments may be linked to or denominated in foreign currencies. Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars or linked to U.S. investments. The value of an

investment denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment denominated in a foreign currency, like certain of the investments included in the Index, is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings. In certain “restricted market” countries (which limit the ability of non-nationals to transact in those countries’ currencies), the Fund will be limited in its ability to use multiple dealers to obtain exchange rates. This may result in potentially higher costs for the Fund, and increased correlation risk. Further the limitation on dealers may cause delays in execution, which may also increase correlation risk.

- **Foreign Investments/Emerging Market Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index’s performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund’s ability to purchase or sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.

Because the Fund’s foreign investments will include issuers domiciled in developing or “emerging market” countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country’s currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating

downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks issued by companies in European Countries to fall (in some cases drastically) and may cause the value of stocks issued by companies in European countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, which may negatively impact the Fund's returns.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on the BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund and the Index generally value such securities as of their local market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
- **Tax Risk** – In order to qualify as a regulated investment company for federal income tax purposes, the Fund must meet certain requirements regarding, among other things, the diversification of its assets. Given the limited number of securities in its index, the Fund has an increased risk of failing such diversification requirements. As a result of such requirements, the Fund's investments could be limited by the Fund's intention to qualify as a regulated investment company and could bear adversely on the Fund's ability to so qualify. If in any year the Fund were to fail to qualify as a regulated investment company, it would be taxed in the same manner as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce the Fund's net assets and the amount of income available for distribution.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may

be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund’s investment results during its first full calendar year of operations, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 06/30/2014): 3.50%

Worst Quarter (ended 09/30/2014): -8.56%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 5.93%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-2.64%	7.95%	2/26/13
After Taxes on Distributions	-4.63%	4.85%	—
After Taxes on Distributions and Sale of Shares	-0.93%	5.10%	—
LPX Direct Listed Private Equity Index TR	-2.05%	8.79%	—

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since February 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually.

## Investment Objective

ProShares Large Cap Core Plus (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Credit Suisse 130/30 Large Cap Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.22%

### Total Annual Fund Operating Expenses Before

<b>Fee Waivers and Expense Reimbursements</b>	<b>0.97%</b>
Fee Waiver/Reimbursement*	-0.52%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.45%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.45% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$46	\$257	\$486	\$1,142

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 49% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate may be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should track the performance of the Index. The Index is designed to replicate an investment strategy that establishes either long or short positions in the stocks of 500 leading large-cap U.S. companies (the “Universe”) by applying a rules-based ranking and weighting methodology. The Index intends to provide a representation of a quantitatively constructed 130/30 U.S. large cap equity strategy. This results in the Index having total long exposure of 130% and total short exposure of 30% at each monthly reconstitution date. In determining individual constituents and weightings consideration is given to 50 factors including fundamental data from financial statements, consensus earnings forecasts, market pricing and volume data. These 50 factors are grouped into ten equal-weighted factor composites in the following categories: 1) Traditional Value; 2) Relative Value; 3) Historical Growth; 4) Expected Growth; 5) Profit Trends; 6) Accelerating Sales; 7) Earnings Momentum; 8) Price Momentum; 9) Price Reversal; and 10) Small Size. The Index will have risk characteristics similar to the Universe and will generally rise and fall with the Universe, with the goal, but not the guarantee, of incremental risk-adjusted outperformance as compared to the Universe. As of June 30, 2015, the Index contained 302 long and 142 short positions. The Index is published under the Bloomberg ticker symbol “CS13030.” The long portion (i.e., +130) of the Index is published under the Bloomberg ticker symbol “CS130L” and the short portion (i.e., -30) of the Index is published separately under the Bloomberg ticker symbol “CS130S.”

For a further description of the Index, please see “Additional Information on Certain Underlying Indexes” in the back of the Fund’s Full Prospectus. The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in or taking short positions in the equity securities comprising the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard

“swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in investments that make up the Index or in financial instruments that provide similar exposure. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- **Long/Short Risk** – The Fund seeks long exposure to certain securities and short exposure to certain other securities. There is no guarantee that the returns on the Fund’s long or short positions will produce high, or even positive, returns and the Fund could lose money if either or both the Fund’s long and short positions produce negative returns. In addition, the Fund may gain enhanced long exposure to certain securities (i.e., obtain investment exposure that exceeds the amount directly invested in those assets, a form of leverage) and, under such circumstances, will lose more money in market environments that are adverse to its long positions than funds that do not employ such leverage. As a result, such investments may give rise to losses that exceed the amount invested in those assets.
- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund’s correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its investment objective.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments.

In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Index Performance Risk** – There is no guarantee or assurance that the methodology used to create the Index will result in the Fund achieving high, or even positive, returns. The Index may underperform more traditional indices. In turn, the Fund could lose value while other indices or measures of market performance increase in value.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily net asset value ("NAV") of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few

counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or "short" exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 12.17%

Worst Quarter (ended 9/30/2011): -14.98%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.68%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	16.12%	16.09%	19.55%	7/13/2009
After Taxes on Distributions	15.72%	15.86%	19.32%	—
After Taxes on Distributions and Sale of Shares	9.43%	13.01%	16.06%	—
Credit Suisse 130/30 Large Cap Index <sup>#</sup>	16.88%	17.17%	20.67%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually.

## Investment Objective

ProShares S&P 500 Dividend Aristocrats ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the S&P 500® Dividend Aristocrats® Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.35%
Other Expenses	0.23%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>0.58%</b>
Fee Waiver/Reimbursement*	-0.23%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.35%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.35% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$36	\$163	\$301	\$704

The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 18% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index, constructed and maintained by S&P Dow Jones Indices LLC, targets companies that are currently members of the S&P 500®, have increased dividend payments each year for at least 25 years, and meet certain market capitalization and liquidity requirements. The Index contains a minimum of 40 stocks, which are equally weighted, and no single sector is allowed to comprise more than 30% of the Index weight. If there are fewer than 40 stocks with at least 25 consecutive years of dividend growth or if sector caps are breached, the Index will include companies with shorter dividend growth histories. The Index is rebalanced each January, April, July and October, with an annual reconstitution during the January rebalance. The Index is published under the Bloomberg ticker symbol “SPDAUDT”.

The Fund invests in securities that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in common stock issued by U.S. public companies.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of securities that make up the Index, holding each security in approximately the same proportion as its weighting in the Index. At times, the Fund may gain exposure to only a representative sample of the securities in the Index, which exposure is intended to have aggregate characteristics similar to those of the Index, and may invest in securities not contained in the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors’ view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the Consumer Staples industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund’s correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of securities that make up the Index in approximately the same proportion as their weighting in the Index, at times, the Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or under-exposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its investment objective.
- **Consumer Staples Industry Risk** – The Fund is subject to risks faced by companies in the consumer staples economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or adverse market developments may cause the value of an investment in the Fund to decrease.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily net asset value (“NAV”) of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur portfolio turnover to manage the Fund’s investment exposure. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund's investment results during its first full calendar year of operations, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2014): 8.63%

Worst Quarter (ended 3/31/2014): 0.90%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.78%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	15.38%	22.04%	10/9/2013
After Taxes on Distributions	14.91%	21.57%	—
After Taxes on Distributions and Sale of Shares	9.04%	16.84%	—
S&P 500® Dividend Aristocrats® Index <sup>#</sup>	15.76%	22.48%	—

<sup>#</sup>Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares S&P MidCap 400 Dividend Aristocrats ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the S&P MidCap 400® Dividend Aristocrats Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.40%
Other Expenses*	2.48%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*\*

**2.88%**  
-2.48%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.40%**

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\*ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.40% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Year
\$41	\$656

The Fund pays transaction costs associated with transacting in securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover rate for the Fund may indicate higher

transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the period from February 3, 2015 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 7% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index, constructed and maintained by S&P Dow Jones Indices LLC, targets companies that are currently members of the S&P Mid-Cap 400® Index and have increased dividend payments each year for at least 15 years. The Index includes all companies meeting these requirements and includes a minimum of 40 stocks, each of which is equally weighted. No single sector is allowed to comprise more than 30% of the Index’s weight. If there are fewer than 40 stocks with at least 15 consecutive years of dividend growth or if sector caps are breached, the Index will include companies with shorter dividend growth histories. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.8 billion and \$10.6 billion. The Index is rebalanced each January, April, July and October, with an annual reconstitution during the January rebalance. The Index is published under the Bloomberg ticker symbol “SPDAMCUT”.

For a further description of the Index, please see “Additional Information About the Underlying Indexes” in the back of the Fund’s Full Prospectus.

The Fund invests in securities that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in common stock issued by U.S. public companies.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of securities that make up the Index, holding each security in approximately the same proportion as its weighting in the Index. At times, the Fund may gain exposure to only a representative sample of the securities in the Index, which exposure is intended to have aggregate characteristics similar to those of the Index, and may invest in securities not contained in the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors’ view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

#### Principal Risks Related to the Fund

- Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund’s correlation with the Index, include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all of its assets in the types of securities that make up the Index in approximately the same proportion as the Index, at times, the Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its investment objective.
- Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the underlying index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares, and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily net asset value (“NAV”) of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming shares directly with the Fund.
- Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur portfolio turnover to manage the Fund’s investment exposure. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be

dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.

### Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since February 2015.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares Russell 2000 Dividend Growers ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Russell 2000 Dividend Growth Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.40%
Other Expenses*	2.74%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.14%</b>
Fee Waiver/Reimbursement**	-2.74%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.40%</b>
--	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.40% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Year</b>
\$41	\$710

The Fund pays transaction costs associated with transacting in securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund

Operating Expenses or in the example above, affect the Fund’s performance. During the period from February 3, 2015 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 7% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index, constructed and maintained by Russell Investments, targets companies that are currently members of the Russell 2000 Index, have increased dividend payments each year for at least 10 consecutive years, and are not in the bottom 20% of Russell 2000 Index liquidity based on 20 day average daily dollar trading volume (collectively, the “Initial Index Requirements”). The Index contains a minimum of 40 stocks, which are equally weighted, and no single sector is allowed to comprise more than 30% of the Index’s weight. The Index includes all companies meeting the Initial Index Requirements, unless, as described below, sector caps are breached. If there are fewer than 40 stocks with at least 10 consecutive years of dividend growth, the Index will include companies with shorter dividend growth histories. If sector caps are breached, then companies in the applicable sector are removed beginning with companies with the lowest yield, and progressively moving to companies with higher yields, as necessary until the Index complies with its rules. As of June 30, 2015, the Index included companies with capitalizations between approximately \$618 million and \$4.2 billion. The Index is rebalanced each March, June, September and December with an annual reconstitution during the June rebalance. The Index is published under the Bloomberg ticker symbol “R2DIVGRO”.

The Fund is designed to provide investors with a comprehensive solution to their alternatives allocation by investing in the alternative ETFs (i.e., ETFs that invest in alternative asset classes or that have non-traditional investment strategies) comprising its index. The Index is designed to provide diversified exposure to alternative asset classes in order to enhance risk adjusted portfolio returns when combined with a range of traditional investments. It allocates among a comprehensive set of alternative ETFs that employ alternative and non-traditional strategies such as long/short, market neutral, managed futures, hedge fund replication, private equity, infrastructure or inflation-related investments.

For a further description of the Index, please see “Additional Information About the Underlying Indexes” in the back of the Fund’s Full Prospectus.

The Fund invests in securities that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in common stock issued by U.S. public companies.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund

attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index. The Fund may invest in only a representative sample of the securities in the Index or securities not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors' view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index, include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or under-exposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the period from August 19, 2014 (the Fund’s

inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 24% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index, constructed and maintained by MSCI, targets companies that are currently members of the MSCI EAFE Index (“MSCI EAFE”) and have increased dividend payments each year for at least 10 years. The Index contains a minimum of 40 stocks, which are equally weighted. No single sector is allowed to comprise more than 30% of the Index weight, and no single country is allowed to comprise more than 50% of the Index weight. If there are fewer than 40 stocks with at least 10 consecutive years of dividend growth, or if sector or country caps are breached, the Index will include companies with shorter dividend growth histories. The Index is rebalanced each February, May, August and November, with an annual reconstitution during the November rebalance. The Index is published under the Bloomberg ticker symbol “M1EADMAR”.

In order to be included in the Index, companies must first qualify for inclusion in MSCI EAFE. MSCI EAFE includes 85% of free float-adjusted, market capitalization in each industry group in developed market countries, excluding the U.S. and Canada. MSCI determines whether a country is a “developed market” country based on three criteria: economic development within the country (based on gross national income), size and liquidity (i.e., number of companies meeting certain size and liquidity standards in a given market) and market accessibility criteria (reflecting institutional investors’ experiences in investing in a given market). MSCI EAFE includes companies from Europe, Australasia and the Far East, and as of June 30, 2015, MSCI EAFE included companies from: Australia, Austria, Belgium, Denmark, Finland, France, Germany, Hong Kong, Ireland, Israel, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland and the United Kingdom. As of June 30, 2015, MSCI EAFE included companies with capitalizations between approximately \$1 billion and \$232.9 billion. The average capitalization of the companies comprising MSCI EAFE was approximately \$14.3 billion.

The Fund invests in securities that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in the equity securities of companies domiciled in developed market countries, excluding the U.S. and Canada.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index, holding each security in approximately the same

proportion as its weighting in the Index. To the extent that regulatory constraints restrict the Fund's ability to hold securities or obtain exposure in these proportions, the Fund may gain exposure to only a representative sample of the securities in the Index or may overweight or underweight securities of the Index in relation to their composition in the Index or may invest in securities not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors' view of the investment merit of a particular security or company, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2014, the Index was concentrated in the United Kingdom, and in Europe.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the securities that make up the Index in approximately the same proportion as their weighting in the Index, at times, the Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Furthermore, the Fund's currency

holdings may be valued at a different time than the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.

- **Foreign Currency Risk** – Certain of the Fund's investments may be linked to or denominated in foreign currencies. Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars or linked to U.S. investments. The value of an investment denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment denominated in a foreign currency, like certain of the investments included in the Index, is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings.
- **Foreign Investments Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index's performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to purchase or sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is

determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks issued by companies in European Countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, which may negatively impact the Fund's returns.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or adverse market developments may cause the value of an investment in the Fund to decrease.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will

fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their local market closing time, the daily net asset value ("NAV") and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to the risks posed by stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may

be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

### Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since August 2014.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares Hedged FTSE Europe ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the FTSE Developed Europe 100% Hedged to USD Index® (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.27%
Other Expenses*	0.00%

<b>Total Annual Fund Operating Expenses</b>	<b>0.27%</b>
---	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$28	\$87

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Index is a free float-adjusted market cap weighted index comprised of those European stocks that comprise approximately the top 90% of the market capitalization of the European stock market, screened for liquidity. As of June 30, 2015, the Index consists of the following 16 developed market countries: Austria, Belgium/Luxembourg, Denmark, Finland, France, Germany,

Greece, Ireland, Italy, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom. As of June 30, 2015, the Index included 515 companies with capitalizations between approximately \$1.8 billion and \$234.0 billion. The average capitalization of the companies comprising the Index was approximately \$21.2 billion. The long equity positions in the Index are reconstituted and rebalanced each March and September.

The Index seeks to eliminate exposure to (or “hedge” against) fluctuations between the value of the U.S. dollar and the currencies in which the securities of the Index are denominated. In order to effect such a hedge, it applies one-month currency forward rates to the Index’s total equity exposure to each currency. The currency hedge is reset on a monthly basis. While this approach is designed to minimize the impact of currency fluctuations on Fund returns, it does not necessarily eliminate the Fund’s exposure to the underlying currencies. The return of the currency forward contracts the Fund utilizes to implement the hedge may not perfectly offset the actual fluctuations between the underlying currencies and the U.S. dollar, and currency exposure may develop on an intra-month basis. The Index is published under the Bloomberg ticker symbol “GPPS004”.

The Fund invests in securities and financial instruments that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities and derivatives that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in the equity securities of companies included in the Index.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives for effecting currency hedging transactions. These derivatives principally include:
- **Forward Contracts** – Two-party contracts where a purchase or sale of a specific quantity of a commodity, security, foreign currency or other financial instrument is entered into with dealers or financial institutions at a set price, with delivery and settlement at a specified future date. The forward contracts in which the Fund invests generally are settled in cash.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index, holding each security in approximately the same proportion as its weighting in the Index. To the extent that regulatory constraints restrict the Fund’s ability to hold securities or gain exposure in these proportions, the Fund may gain exposure to only a representative sample of the securities in the Index or may overweight or underweight securities of the Index in relation

to their composition in the Index or may invest in securities or financial instruments not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, financial instrument or company, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the United Kingdom.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index, include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the securities that make up the Index in approximately the same proportion as their weighting in the Index, at times, the Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to such securities may be different from

that of the Index. In addition, the Fund may invest in securities or financial instruments not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund and the Fund's foreign currency positions may be valued at a different time than the level of the Index, either of which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. In addition, the Fund's foreign currency hedging strategy may also be unable to perfectly match the Index and will introduce additional costs, both sources of additional correlation risk. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.

- **Exposure to European Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Europe. Many countries included in the Index are members of the European Union (the "EU") and all European countries may be significantly affected by EU policies and may be highly dependent on the economies of their fellow members. The European financial markets have experienced significant volatility over recent years and several European countries have been adversely affected by unemployment, budget deficits and economic downturns. In addition, several European countries have experienced credit rating downgrades, rising government debt levels and, for certain European countries (including Greece, Spain, Portugal, Ireland and Italy), weaknesses in sovereign debt. These events, along with decreasing imports or exports, changes in governmental or EU regulations on trade, the default or threat of default by a European country on its sovereign debt and/or an economic recession in a European country may have a significant adverse effect on the affected European country, issuers in the affected European country, the economies of other European countries, their trading partners or other European countries. Such events, or even the threat of such events, may cause the value of securities issued by issuers in such European countries to fall, in some cases drastically. These events may also cause continued volatility in the European financial markets. To the extent that the Fund's assets are exposed to investments from issuers in European countries or denominated in euro, their trading partners, or other European countries, these events may negatively impact the performance of the Fund.
- **Foreign Currency and Currency Hedging Risk** – Certain of the Fund's investments may be denominated in foreign currencies. Investments denominated in foreign currencies are exposed to more risk than those investments denominated in U.S. dollars. The value of an investment denominated in a foreign currency

could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment denominated in a foreign currency, like certain of the investments included in the Index, is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings.

The Fund seeks to mitigate these foreign currency risks by using short positions in currency forward contracts; such short positions should increase in value when a foreign currency rate decreases versus the U.S. dollar and should decrease in value in when a foreign currency rate increases versus the U.S. dollar, thereby mitigating potential gains and losses in the equity positions of the Fund arising from fluctuations in currency rates. The Fund does not attempt to mitigate other factors which may have a greater influence on the equity positions than currency rate risk. There is no guarantee that the currency forwards will completely eliminate the currency rate risk of the equity positions. Because the currency hedge is reset on a monthly basis, currency risk can develop intra-month. Furthermore, while the Index is designed to hedge currency rate exposure of the equity positions, it is possible that a degree of exposure may remain even at the time of rebalance. Currency hedging may also limit potential gains from the exposure to the equity securities if foreign currencies appreciate or remain unchanged. When foreign currencies appreciate or remain unchanged, an unhedged investment in the same equity securities will outperform the Fund. The Fund could lose money if the equity positions and/or the currency hedged positions produce negative returns. Performance of the Fund could be particularly poor if foreign currencies appreciate at the same time that the value of the equity positions fall.

- **Foreign Investments Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index's performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of

the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to purchase or sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the Fund has a significant concentration in the United Kingdom. The United Kingdom has one of the largest economies in Europe, and the United States and other European countries are substantial trading partners of the United Kingdom. As a result, the British economy may be impacted by changes to the economic condition of the United States and other European countries. The British economy, along with certain other EU economies, experienced a significant economic slowdown during the recent financial crisis, and certain British financial institutions suffered significant losses, were severely under-capitalized and required government intervention to survive. The British economy relies heavily on the export of financial services to the United States and other European countries and, therefore, a prolonged slowdown in the financial services sector may have a negative impact on the British economy. Continued governmental involvement or control in certain sectors may stifle competition in certain sectors or cause adverse effects on economic growth. In the past, the United Kingdom has been a target of terrorism. Acts of terrorism in the United Kingdom or against British interests abroad may cause uncertainty in the British financial markets and adversely affect the performance of the issuers to which the Fund has exposure.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or adverse market developments may cause the value of an investment in the Fund to decrease.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – Fund shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings and supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of the local market closing time, the daily net asset value ("NAV") and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "nondiversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to the risks posed by stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since June 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large

blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares Hedged FTSE Japan ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the FTSE Japan 100% Hedged to USD Index<sup>®</sup> (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.23%
Other Expenses*	0.00%

<b>Total Annual Fund Operating Expenses</b>	<b>0.23%</b>
---	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$24	\$74

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Index is free float-adjusted and market cap weighted, and is comprised of those Japanese stocks that comprise approximately the top 90% of the market capitalization of the Japanese stock market, screened for liquidity. As of June 30, 2015, the Index included 479 companies with capitalizations between approximately \$894.9 million and \$212.6 billion. The average capitalization of the companies comprising the Index was

approximately \$8.7 billion. The long equity positions in the Index are reconstituted and rebalanced each March and September.

The Index seeks to eliminate exposure to (or “hedge” against) fluctuations between the value of the U.S. dollar and the Japanese yen. In order to effect such a hedge, it applies one-month currency forward rates to the Index’s total equity exposure to the Japanese yen. The currency hedge is reset on a monthly basis. While this approach is designed to minimize the impact of currency fluctuations on Fund returns, it does not necessarily eliminate the Fund’s exposure to the underlying currency. The return of the currency forward contracts the Fund utilizes to implement the hedge may not perfectly offset the actual fluctuations between the underlying currencies and the U.S. dollar, and currency exposure may develop on an intra-month basis.

The Index is published under the Bloomberg ticker symbol “GPPS008”.

The Fund invests in securities and financial instruments that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index and comparable securities that have economic characteristics that are substantially identical to the economic characteristics of the securities of the Index).

The securities and derivatives that the Fund will principally invest in are set forth below.

- **Equity Securities** – The Fund invests in the equity securities of companies included in the Index.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives for effecting currency hedging transactions. These derivatives principally include:
  - **Forward Contracts** – Two-party contracts where a purchase or sale of a specific quantity of a commodity, security, foreign currency or other financial instrument is entered into with dealers or financial institutions at a set price, with delivery and settlement at a specified future date. The forward contracts in which the Fund invests generally are settled in cash.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index, holding each security in approximately the same proportion as its weighting in the Index. To the extent that regulatory constraints restrict the Fund’s ability to hold securities or gain exposure in these proportions, the Fund may gain exposure to only a representative sample of the securities in the Index or may overweight or underweight securities of the Index in relation to their composition in the Index or may invest in securities or financial instruments not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to the Index. ProShare Advisors does not invest the assets of the

Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, financial instrument or company, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in Japan.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- **Consumer Goods Industry Risk** – The Fund is subject to risks faced by companies in the consumer goods economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index, include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities

in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the securities that make up the Index in approximately the same proportion as their weighting in the Index, at times, the Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to such securities may be different from that of the Index. In addition, the Fund may invest in securities or financial instruments not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund and the Fund's foreign currency positions may be valued at a different time than the level of the Index, either of which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. In addition, the Fund's foreign currency hedging strategy may also be unable to perfectly match the Index and will introduce additional costs, both sources of additional correlation risk. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.

- **Foreign Currency and Currency Hedging Risk** – Certain of the Fund's investments may be denominated in foreign currencies. Investments denominated in foreign currencies are exposed to more risk than those investments denominated in U.S. dollars. The value of an investment denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment denominated in a foreign currency, like certain of the investments included in the Index, is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings.

The Fund seeks to mitigate these foreign currency risks by using short positions in currency forward contracts; such short positions should increase in value when a foreign currency rate decreases versus the U.S. dollar and should decrease in value when a foreign currency rate increases versus the U.S. dollar, thereby mitigating potential gains and losses in the equity

positions of the Fund arising from fluctuations in currency rates. The Fund does not attempt to mitigate other factors which may have a greater influence on the equity positions than currency rate risk. There is no guarantee that the currency forwards will completely eliminate the currency rate risk of the equity positions. Because the currency hedge is reset on a monthly basis, currency risk can develop intra-month. Furthermore, while the Index is designed to hedge currency rate exposure of the equity positions, it is possible that a degree of exposure may remain even at the time of rebalance. Currency hedging may also limit potential gains from the exposure to the equity securities if foreign currencies appreciate or remain unchanged. When foreign currencies appreciate or remain unchanged, an unhedged investment in the same equity securities will outperform the Fund. The Fund could lose money if the equity positions and/or the currency hedged positions produce negative returns. Performance of the Fund could be particularly poor if foreign currencies appreciate at the same time that the value of the equity positions fall.

- **Foreign Investments Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index's performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to purchase or sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those

foreign countries and geographic regions and subject to the related risks. The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Japan. Such risks include, but are not limited to (i) political, economic, or social instability in Japan; (ii) risks associated with Japan's large government deficit; (iii) natural disasters particularly likely to occur in Japan; and (iv) risks associated with an increasingly aging population that is likely to strain Japan's social welfare and pension systems.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or adverse market developments may cause the value of an investment in the Fund to decrease.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – Fund shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings and supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in

markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of the local market closing time, the daily net asset value (“NAV”) and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “nondiversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to the risks posed by stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or

industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since June 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Investment Objective

ProShares High Yield–Interest Rate Hedged (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Citi High Yield (Treasury Rate-Hedged) Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.50%
Other Expenses	0.31%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

	<b>0.81%</b>
Fee Waiver/Reimbursement*	0.31%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.50%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.50% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within three years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$51	\$228	\$419	\$973

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund

Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 82% of the average value of its entire portfolio. The Fund’s portfolio turnover rate is calculated without regard to derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate may be significantly higher.

## Principal Investment Strategies

The Index (Bloomberg Ticker: “CFIIHYHG”) is comprised of (a) long positions in USD-denominated high yield corporate bonds (“high yield bonds”) and (b) short positions in U.S. Treasury notes or bonds (“Treasury Securities”) of, in aggregate, approximate equivalent duration to the high yield bonds. In entering these positions, the Index seeks to achieve an overall effective duration of zero.

By taking these short Treasury Securities positions, the Index seeks to mitigate the negative impact of rising Treasury interest rates (“interest rates”) on the performance of high yield bonds (conversely limiting the positive impact of falling interest rates). The short positions are not intended to mitigate other factors influencing the price of high yield bonds, such as credit risk, which may have a greater impact than rising or falling interest rates.

The long high yield bond positions included in the Index are designed to represent the more liquid universe of high yield bonds offered within the United States. Currently, the bonds eligible for inclusion in the Index include high yield bonds that are issued by companies domiciled in the U.S. and Canada, and that: are fixed-rate (including callable bonds); have a maximum rating of Ba1/BB+ by both Moody’s Investors Service, Inc. (“Moody’s”) and Standard and Poor’s Financial Services, LLC (“S&P”); and are subject to minimum issue outstanding, minimum time-to-maturity and maximum-time from issuance criteria. Pay-in-kind and zero-coupon bonds are excluded. No more than two issues from each issuer are allowed, and no more than two percent (2%) of the Index is allocated to any single issuer. The Index is reconstituted and rebalanced (including a reset of the interest rate hedge) on a monthly basis.

Relative to a long-only investment in the same high yield bonds, the Index should outperform in a rising interest rate environment and underperform in a falling or static interest rate environment. Performance of the Index could be particularly poor in risk-averse, flight-to-quality environments when it is common for high yield bonds to decline in value and for interest rates to fall. In addition, the performance of the Index, and by extension the Fund, depends on many factors beyond rising or falling interest rates, such as the perceived level of credit risk in the high yield bond positions. These factors may be as or more important to the performance of the Index than the impact of interest rates. As such, there is no guarantee that the Index, and accordingly, the Fund, will have positive performance even in environments of sharply rising interest rates. The Index may be more volatile than a long-only position in the same high yield bonds.

As of June 30, 2015, the Index was comprised of approximately 176 bonds issued from approximately 123 different issuers.

For a further description of the Index, please see “Additional Information on Certain Underlying Indexes” in the back of the Fund’s Full Prospectus.

The Fund invests in a combination of securities and derivatives that ProShare Advisors believes should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in high-yield bonds included in the Index.

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances will typically be held in money market instruments.

- **Debt Securities** – The Fund invests in debt securities, primarily high yield bonds, that are issued by corporate issuers that are rated below “investment-grade” by both Moody’s and S&P. Credit rating agencies evaluate issuers and assign ratings based on their opinions of the issuer’s ability to pay interest and principal as scheduled. Those issuers with a greater risk of default—not paying interest or principal in a timely manner—are rated below investment grade. Such debt securities may include Rule 144A securities, which generally are restricted securities that are only available to “qualified” investors.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund primarily invests in derivatives as a substitute for obtaining short exposure in U.S. Treasury Securities but may also do so to a limited extent to obtain high yield bond exposure. These derivatives principally include:
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement. The Fund will use futures contracts to obtain short exposure to U.S. Treasury Securities.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in investments that make up the Index or in financial instruments that provide similar exposure. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index, including the general credit profile of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. In seeking to match the general credit profile of the Index, ProShare Advisors will rely solely on credit ratings provided by Moody’s and S&P. To the extent the Fund is overweight in a security that is perceived by the markets to have increased credit risk, the Fund’s performance will be adversely affected.

The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends, direction or the financial condition of a particular high yield bond issuer.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index’s long exposure was concentrated in the industrials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **High Yield Risk** – Exposure to high yield (lower rated) debt instruments (also known as “junk bonds”) may involve greater levels of credit, prepayment, liquidity and valuation risk than for higher rated instruments. High yield debt instruments may be more sensitive to economic changes, political changes, or adverse developments specific to a company than other fixed income instruments. These securities are subject to greater risk of loss, greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market for securities. High yield debt instruments are considered speculative with respect to the issuer’s continuing ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than higher rated debt instruments. An economic downturn or period of rising interest rates could adversely affect the market for these securities and reduce market liquidity (liquidity risk). Less active markets may diminish the Fund’s ability to obtain accurate market quotations when valuing the portfolio securities and thereby give rise to valuation risk. High yield debt instruments may also present risks based on payment expectations. For example, these instruments may contain redemption or call provisions. If an issuer exercises these provisions in a declining interest rate market, the Fund would have to replace the security with a lower yielding security, resulting in a decreased return for investors. If the issuer of a security is in default with respect to interest or principal payments, the issuer’s security could lose its entire value. Furthermore, the transaction costs associated with the purchase and sale of high yield debt instruments may vary greatly depending upon a number of factors and may adversely affect the Fund’s performance.
- **Hedging Risk** – The Index seeks to mitigate the potential negative impact of rising Treasury interest rates on the performance of high yield bonds. The short positions in U.S. Treasury Securities are not intended to mitigate credit risk or other factors influencing the price of high yield bonds, which may have a greater impact than rising or falling interest rates. There is no guarantee that the short positions will completely eliminate the interest rate risk of the long high yield bond

positions. While the Fund seeks to achieve an effective duration of zero, the hedge cannot fully account for changes in the shape of the Treasury interest rate (yield) curve. Because the duration hedge is reset on a monthly basis, interest rate risk can develop intra-month. The Fund could lose money if either or both the Fund's long and short positions produce negative returns.

When interest rates fall, an unhedged investment in the same high yield bonds will outperform the Fund. Performance of the Fund could be particularly poor if high yield bond credit deteriorates at the same time Treasury interest rates fall. Furthermore, when interest rates remain unchanged, an investment in the Fund will underperform a long-only investment in the same high yield bonds due to the ongoing costs associated with short exposure to Treasury securities.

The Index may also contain a significant allocation to callable high yield bonds, which are subject to call/prepayment risk (see "Debt Instrument Risk" below); callable bonds may have lower sensitivity to interest rate declines than non-callable bonds or U.S. Treasury Securities. In certain falling interest rate environments, this could result in disproportionately larger losses in the short Treasury positions relative to the gains in the long high yield bond positions attributable to falling interest rates.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. This may be due, in many cases, to the impact of a limited trading market in the component Index bonds on the calculation of the Index. Other factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in

financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or under-exposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change.
- **Credit Risk** – Due to its investments in high yield bonds, the Fund will be subject to the risk that an issuer of a high yield bond is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the high yield bonds that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the bonds decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities. **The hedging methodology of the Index does not seek to mitigate credit risk.**
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities typically fluctuates more in response to interest rate changes than securities with shorter maturities. The Index (and therefore the Fund) seeks to

mitigate this risk by taking short positions in U.S. Treasury Securities; such short positions should increase in value in rising interest rate environments and should decrease in value in falling interest rate environments, thereby mitigating gains and losses in the high yield bond positions of the Fund arising from changing Treasury interest rates. The Index does not attempt to mitigate credit risk or other factors which may have a greater influence on high yield bonds than interest rate risk. Such other factors may impact high yield bond prices in an opposite way than interest rates making it difficult to directly observe the impact of changes in interest rates on high yield bonds. When interest rates fall, an unhedged investment in the same high yield bonds will outperform the Fund. Because the duration hedge is reset on a monthly basis, interest rate risk can develop intra-month. Furthermore, while the Index is designed to hedge the interest rate exposure of the long high yield bond positions, it is possible that a degree of exposure may remain even at the time of rebalance.

- **Restricted Securities Risk** – Privately issued securities are restricted securities that are not publicly traded, and may be less liquid than those that are publicly traded. At times, such securities cannot be readily bought or sold and the Fund might be unable to acquire or dispose of such securities promptly or at reasonable prices, which may result in a loss to the Fund. A restricted security that was liquid at the time of purchase may subsequently become illiquid.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities, futures, and other instruments correlated with these markets may fluctuate

dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.

- **Industrial Industry Debt Risk** – The Fund is subject to risks related to the debt issued by companies in the industrial economic sector to the same extent as the Index is so concentrated, including effects on issuer credit from: supply and demand both for their specific product or service and for industrial sector products in general; decline in demand for products due to rapid technological developments and frequent new product introduction; effects on securities prices and profitability from government regulation, world events and economic conditions; and risks for environmental damage and product liability claims.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily net asset value ("NAV") and Index performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Because of the nature of high yield bonds,

shares may typically trade at a larger premium or discount to the value of the Fund's holdings than shares of many other ETFs. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains. Such activity may have a particularly significant impact on funds (like the Fund) that seek long exposure to high yield bonds.
- **Short Sale Exposure Risk** – The Fund may seek inverse or "short" exposure through financial instruments such as futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund's investment results during its first full calendar year of operations, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2014): 1.47%

Worst Quarter (ended 9/30/2014): -2.61%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.14%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-2.50%	0.07%	5/21/2013
After Taxes on Distributions	-4.67%	-2.13%	—
After Taxes on Distributions and Sale of Shares	-1.38%	-0.90%	—
Citi High Yield (Treasury Rate-Hedged) Index*	-1.14%	1.23%	—

\* Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since May 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, monthly, and capital gains, if any, at least annually.

## Investment Objective

ProShares Investment Grade—Interest Rate Hedged (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Citi Corporate Investment Grade (Treasury Rate-Hedged) Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.30%
Other Expenses	0.33%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

	<b>0.63%</b>
Fee Waiver/Reimbursement*	-0.33%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.30%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.30% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$31	\$168	\$319	\$755

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a

taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 43% of the average value of its entire portfolio. The Fund’s portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Index (Bloomberg Ticker: CFIIIGHG) is comprised of (a) long positions in USD-denominated investment grade corporate bonds issued by both U.S. and foreign domiciled companies; and (b) short positions in U.S. Treasury notes or bonds (“Treasury Securities”) of, in aggregate, approximate equivalent duration to the investment grade bonds. In entering these positions, the Index seeks to achieve an overall effective duration of zero.

By taking short Treasury Security positions (of an aggregate dollar value not exceeding the aggregate dollar value of the Fund’s assets), the Index seeks to mitigate the negative impact of rising Treasury interest rates (“interest rates”) on the performance of investment grade bonds (conversely limiting the positive impact of falling interest rates). The short positions are not intended to mitigate other factors influencing the price of investment grade bonds, such as credit risk, which may have a greater impact than rising or falling interest rates.

The long investment grade bond positions included in the Index are designed to represent the more liquid universe of investment grade bonds offered within the United States. Currently, the bonds eligible for inclusion in the Index include all investment grade bonds that are issued by U.S. and internationally domiciled companies that: are fixed rate; have a minimum rating of Baa3/BBB- by both Moody’s Investors Service, Inc. (“Moody’s”) and Standard and Poor’s Financial Services, LLC (“S&P”); have a minimum face amount outstanding of \$1 billion; and have at least five and a half (5.5) years until maturity. The Index is reconstituted and rebalanced (including a reset of the interest rate hedge) on a monthly basis.

Relative to a long-only investment in the same investment grade bonds, the Index should outperform in a rising interest rate environment and underperform in a falling or static interest rate environment. Performance of the Index could be particularly poor if investment grade credit deteriorates at the same time that Treasury interest rates fall. In addition, the performance of the Index, and by extension the Fund, depends on many factors beyond rising or falling interest rates, such as the perceived level of credit risk in the investment grade bond positions. These factors may be as or more important to the performance of the Index than the impact of interest rates. As such, there is no guarantee that the Index, and accordingly, the Fund, will have positive performance even in environments of sharply rising interest rates in which the short positions might be expected to mitigate the effect of such rises. The Index may be more volatile than a long-only position in the same investment grade bonds.

As of June 30, 2015, the Index was composed of approximately 466 bonds from approximately 147 different issuers.

In addition, as of June 30, 2015, approximately 71% of the investment grade bonds that comprise the Index were issued by U.S. domiciled companies and 29% of the investment grade bonds that comprise the Index were issued by foreign domiciled companies.

For a further description of the Index, please see “Description of the Index” in the Fund’s Full Prospectus.

The Fund invests in a combination of debt securities and derivatives that ProShare Advisors believes should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index) and invest at least 80% of its total assets in investment grade bonds.

The debt securities and derivatives that the Fund will principally invest in are set forth below. Cash balances will typically be held in money market instruments.

- **Debt Securities** – The Fund invests in debt securities, primarily investment grade bonds, that are issued by corporate issuers that are rated “investment-grade” by both Moody’s and S&P. Credit rating agencies evaluate issuers and assign ratings based on their opinions of the issuer’s ability to pay interest and principal as scheduled. The bonds invested in by the Fund may include USD-denominated bonds issued by foreign-domiciled companies that are offered for sale in the United States.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund primarily invests in derivatives as a substitute for obtaining short exposure in Treasury Securities but may also do so to a limited extent to obtain investment grade bond exposure. These derivatives principally include:
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement. The Fund will primarily utilize short futures contracts on Treasury Securities.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of investments that make up the Index or in financial instruments that provide similar exposure. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index, including the general credit profile of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. In seeking to match the general

credit profile of the Index, ProShare Advisors will rely solely on credit ratings provided by Moody’s and S&P. To the extent the Fund is overweight in a security that is perceived by the markets to have increased credit risk, the Fund’s performance will be adversely affected.

The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends, direction or the financial condition of a particular investment grade bond issuer.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of June 30, 2015, the Index’s long exposure was concentrated in the industrials and the financial services industry groups.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. These factors may cause the value of an investment in the Fund to change.
- **Hedging Risk** – The Index seeks to mitigate the potential negative impact of rising Treasury interest rates on the performance of investment grade bonds. The short positions in Treasury Securities are not intended to mitigate credit risk or other factors influencing the price of investment grade bonds, which may have a greater impact than rising or falling interest rates. There is no guarantee that the short positions will completely eliminate the interest rate risk of the long investment grade bond positions. While the Fund seeks to achieve an effective duration of zero, the hedge cannot fully account for changes in the shape of the Treasury interest rate (yield) curve. Because the duration hedge is reset on a monthly basis, interest rate risk can develop intra-month. The Fund could lose money if either or both the Fund’s long and short positions produce negative returns.

When interest rates fall, an unhedged investment in the same investment grade bonds will outperform the Fund. Performance of the Fund could be particularly poor if investment grade credit deteriorates at the same time that Treasury interest rates fall. Furthermore, when interest rates remain unchanged, an investment in the Fund will underperform a long-only investment in the same investment grade bonds due to the ongoing costs associated with short exposure to Treasury securities.

There is no guarantee the Fund will have positive returns, even in environments of sharply rising Treasury interest rates in which the Fund’s short positions might be expected to mitigate the effects of such rises.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. This may be due, in many cases, to the impact of a limited trading market in the component Index bonds on the calculation of the Index. Other factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- Credit Risk** – Due to its investments in investment grade bonds, the Fund will be subject to the risk that an issuer is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the investment grade bonds that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the bonds decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities. **The hedging methodology of the Index does not seek to mitigate credit risk.**
- Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities. The Index (and therefore the Fund) seeks to mitigate this risk by taking short positions in Treasury Securities; such short positions should increase in value in rising interest rate environments and should decrease in value in falling interest rate environments, thereby mitigating gains and losses in the investment grade bond positions of the Fund arising from changing Treasury interest rates. The Index does not attempt to mitigate credit risk or other factors which may have a greater influence on investment grade bonds than interest rate risk. Such other factors may impact investment grade bond prices in an opposite way than interest rates making it difficult to directly observe the impact of changes in interest rates on investment grade bonds. When interest rates fall, an unhedged investment in the same investment grade bonds will outperform the Fund. Because the duration hedge is reset on a monthly basis, interest rate risk can develop intra-month. Furthermore, while the Index is designed to hedge the interest rate exposure of the long investment grade bond positions, it is possible that a degree of exposure may remain even at the time of rebalance.
- Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific

securities, or the ability to buy or sell certain securities or derivatives may be restricted, which may result in the Fund being unable to buy or sell certain securities or derivatives. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Financial Services Industry Debt Risk** – The Fund is subject to risks related to the debt issued by companies in the financial services economic sector to the same extent as the Index is so concentrated, including effects on issuer credit from: extensive governmental regulation and/or nationalization that affects the scope of a financial services company's activities, the prices that financial services companies can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and other financial services companies may be subject; and increased inter-industry consolidation and competition in the financial sector.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.
- **Industrial Industry Debt Risk** – The Fund is subject to risks related to the debt issued by companies in the industrial economic sector to the same extent as the Index is so concentrated, including effects on issuer credit from: supply and demand both for their specific product or service and for industrial sector products in general; decline in demand for products due to rapid technological developments and frequent new product introduction; effects on securities prices and profitability from government regulation, world events and economic conditions; and risks for environmental damage and product liability claims.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or derivatives in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or derivatives in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily net asset value ("NAV") and Index performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Because of the nature of investment grade bonds, shares may trade at a larger premium or discount to the value of the Fund's holdings than shares of many other ETFs. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains. Such activity may have a particularly significant impact on funds (like the Fund) that seek long exposure to investment grade bonds.
- **Short Sale Exposure Risk** – The Fund may seek inverse or "short" exposure through financial instruments such as futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain short exposure through financial instruments such as futures contracts, or require the Fund to seek short exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may

be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining short exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund's investment results during its first full calendar year of operations, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2014): 0.77%

Worst Quarter (ended 12/31/2014): -1.96%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.13%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-1.92%	0.51%	11/5/2013
After Taxes on Distributions	-3.38%	-1.00%	—
After Taxes on Distributions and Sale of Shares	-1.07%	-0.28%	—
Citi Corporate Investment Grade (Treasury Rate-Hedged) Index <sup>#</sup>	-1.10%	1.58%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since November 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, monthly, and capital gains, if any, at least annually.

## Investment Objective

ProShares USD Covered Bond (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Solactive® Diversified USD Covered Bond Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.35%
Other Expenses	2.18%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.53%</b>
Fee Waiver/Reimbursement*	-2.18%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.35%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.35% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year.

Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$36	\$579	\$1,148	\$2,701

The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 153% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund seeks to meet its investment objective by, under normal circumstances, investing substantially all of its assets in “Covered Bonds.” Covered Bonds are debt instruments, issued by a financial institution and secured by a segregated pool of financial assets (the “cover pool”), typically comprised of mortgages or, in certain cases, public-sector loans. The cover pool, typically maintained by the issuing financial institution, is designed to pay Covered Bond holders in the event that there is a default on the payment obligations of a Covered Bond. To the extent the cover pool assets are insufficient to repay principal and/or interest, Covered Bond holders also have a senior, unsecured claim against the issuing financial institution. Covered Bonds differ from other debt instruments, including asset-backed securities, in that Covered Bond holders have claims against both the cover pool and the issuing financial institution.

The Index, published by Solactive AG, seeks to track the performance of U.S. dollar-denominated Covered Bonds that are generally rated “AAA” (or its equivalent). Specifically, the Index aims to include the universe of U.S. dollar-denominated fixed-rate Covered Bonds that conform to the eligibility criteria for the Index. The Covered Bonds must be denominated in USD, have a fixed-rate coupon, have at least 18 months to maturity, have USD 1 billion or more of outstanding face amount and a minimum denomination no greater than \$250,000, be either registered with the Securities and Exchange Commission or eligible for resale under Rule 144A under the Securities Act of 1933, and satisfy the liquidity criteria applicable to the Index. In addition, the Covered Bonds must be rated in the highest category by at least one of the following rating agencies: Fitch Investor Services, Moody’s Investor Services or Standard & Poor’s Rating Group. When the Covered Bond is rated by all three agencies, two of the agencies must rate the bond “AAA” (or its equivalent); when the bond is rated by two of such agencies, both agencies must rate the bond “AAA” (or its equivalent); and when the bond is rated by only one of such rating agency, that agency must rate the bond “AAA” (or its equivalent). Covered Bonds containing puts or calls and bonds that are convertible or have equity-like features are not eligible for inclusion in the Index. In addition, the following diversification criteria are applied to the Index when it is rebalanced: no single issuer may have a value weight greater than 25% of the value of the Index and issuers with a value weight of 5% or more may not constitute more than 50% of the value of the Index. For purposes of the diversification criteria, bonds issued by affiliated issuers (i.e., issuers under common control) will be treated as being issued by the same issuer. If a Covered Bond no longer satisfies the eligibility criteria, it will be removed from the Index when the Index is rebalanced. The Index is rebalanced on the last business day of the following months: January, April, July and October.

As of the date of this Prospectus, the Index was comprised of Covered Bonds issued exclusively by non-U.S. institutions. As of

June 30, 2015, the Index was comprised of 44 Covered Bonds issued by 21 different issuers, all of which are financial institutions. These issuers are primarily Canadian and European and come from: Canada (32.85%); Norway (7.94%); France (1.51%); Sweden (11.02%); United Kingdom (9.10%); Australia (30.71%); Netherlands (2.26%); Germany (1.53%); and Switzerland (3.09%). The above weights represent the percentage of dollars invested per country. The Index is published under the Bloomberg ticker symbol “COBOUSD”.

The securities that the Fund will principally invest in are set forth below.

- **Debt Securities** – The Fund invests in debt securities, primarily Covered Bonds that are issued by a financial institution and are secured by a pool of financial assets, typically mortgages (e.g., residential, commercial and/or ship mortgages) or, in certain cases, public-sector loans, which are loans made to national, regional and local authorities to fund public-sector lending (e.g., loans that support public investment and infrastructure projects). In addition, the pool of financial assets may include cash or cash equivalents.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index. The Fund may invest in only a representative sample of the securities in the Index or securities not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financial services industry group and in Canada and in Europe.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Specific to Covered Bonds** – While Covered Bonds are secured by a pool of assets (the “cover pool”), there is no guarantee that the cover pool will adequately or fully compensate Covered Bond holders in the event that an issuer defaults on its payment obligations. In the event of such default, while the Covered Bond structure is designed to ensure continued timely interest payments to the Covered Bond holders and to avoid acceleration of payment under the Covered Bonds, the Fund

could, in certain cases, obtain assets of the cover pool, which may be difficult to liquidate, rather than cash. These assets may be difficult to value. See “Valuation Risk” below for more information. Assets that comprise a cover pool, such as mortgages or public-sector loans, may also decline in value. See “Mortgage and Public-Sector Loan Risk” below for more information. Accordingly, upon an issuer default, a Fund may experience significant delays in obtaining any amounts for the cover pool and/or may obtain only limited amounts or no amounts in certain circumstances. Market practice surrounding the maintenance of a cover pool, including custody arrangements, varies based on the jurisdiction in which the Covered Bonds are issued. Certain jurisdictions may afford lesser protections regarding the amount cover pools are required to maintain or the manner in which such assets are held. Investors should be aware that Canadian Covered Bonds (and potentially those of certain other jurisdictions that the Fund may invest in) are governed by contractual arrangements, rather than a specific legislative legal framework. Also, because certain Covered Bonds may benefit from the support of a sovereign government, such Covered Bonds may be negatively affected to the extent that the creditworthiness of the sovereign government is negatively affected. Further, while Covered Bond holders have a preferential claim on cover pool assets, senior to other creditors, there is no guarantee that such a claim will provide an amount equal to the obligations owed to Covered Bond holders. If the proceeds in a cover pool are not sufficient to cover the obligations owed to investors of a Covered Bond held by the Fund, the Fund may attempt to recover the shortfall as a senior unsecured creditor but may still be prevented from realizing the full amount of principal and interest due. As a result, Fund shareholders may incur losses, which may be significant.

Investors should be aware that the rating of the underlying issuer of a Covered Bond may be lower than the rating of the Covered Bond.

Also, due to demand from other investors, certain Covered Bonds may be less accessible to the capital markets and may be difficult for the Fund to acquire. This may cause the Fund, at times, to pay a premium to obtain such securities or may result in the Fund being underexposed to such securities, in relation to the Index.

- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities typically fluctuates more in response to interest rate changes than securities with shorter

maturities. Interest rate risk is generally based on the currency in which the instrument is denominated, in this case the U.S. dollar.

- **Restricted Securities Risk** – The Fund will typically invest in privately placed Covered Bonds, including those which may be resold only in accordance with Rule 144A under the Securities Act of 1933. Privately issued securities are restricted securities that are not publicly traded, and may be less liquid than those that are publicly traded. At times, such securities cannot be readily bought or sold and the Fund might be unable to acquire or dispose of such securities promptly or at reasonable prices, which may result in a loss to the Fund. A restricted security that was liquid at the time of purchase may subsequently become illiquid.
- **Mortgage and Public-Sector Loan Risk** – Because the Fund's investments in Covered Bonds are secured by a pool of financial assets that may include mortgages and, in certain cases, public-sector loans, the Fund may be indirectly exposed to the risks posed by mortgages and/or public-sector loans. These risks include interest rate risk, extension risk (i.e., the risk that an issuer will exercise its right to pay principal later than expected) and prepayment risk (i.e., the risk that an issuer will exercise its right to pay principal earlier than expected). Because of these risks, any mortgages or public-sector loans may be subject to greater volatility as a result of slight movements in interest rates (either increases or decreases) that may have the effect of quickly increasing or decreasing the value of certain mortgages or public-sector loans that collateralize investments held by the Fund.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. These factors may cause the value of an investment in the Fund to change. All Covered Bonds held by the Fund are sold prior to maturity, which can result in losses.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Geographic Concentration Risk** – Because the Fund currently focuses its investments primarily in Covered Bonds issued by European and Canadian financial institutions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular,

the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of debt issued by issuers in European countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, either of which may negatively impact the Fund's returns.

The Fund may also invest in Covered Bonds issued in other regions.

- **Financial Services Industry Debt Risk** – The Fund is subject to risks related to the debt issued by companies in the financial services industry to the same extent as the Index is so concentrated, including effects on issuer credit from: extensive governmental regulation and/or nationalization that affects the scope of a financial services company's activities, the prices that financial services companies can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and other financial services companies may be subject; and increased inter-industry consolidation and competition in the financial sector.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their local market closing time, the daily net asset value ("NAV") and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations.

Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31

Best Quarter (ended 6/30/2014): 0.73%

Worst Quarter (ended 6/30/2013): -1.11%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 0.81%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	1.23%	1.43%	5/21/2012
After Taxes on Distributions	0.79%	1.01%	—
After Taxes on Distributions and Sale of Shares	0.69%	0.91%	—
BNP Paribas Diversified USD Covered Bond Index/ Solactive® Diversified USD Covered Bond Index*	1.75%	1.88%	—

\* Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 65,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, monthly, and capital gains, if any, at least annually.

## Investment Objective

ProShares German Sovereign/Sub-Sovereign ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Markit iBoxx EUR Germany Sovereign & Sub-Sovereign Liquid Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.35%
Other Expenses	3.14%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.49%</b>
Fee Waiver/Reimbursement*	-3.04%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.45%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.45% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$46	\$787	\$1,550	\$3,562

The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 45% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund seeks to meet its investment objective by, under normal circumstances, investing substantially all of its assets in fixed-rate debt securities of the Federal Republic of Germany (“Sovereign”) as well as local governments and entities or agencies guaranteed by various German governments (“Sub-Sovereign”) issuers.

The Index, published by Markit Group Limited, seeks to track the performance of Sovereign and Sub-Sovereign issuers. Qualifying constituents must be rated “Investment Grade” or higher (based on an average of ratings issued by Moody’s Investor Services, Inc. (“Moody’s”), Standard & Poor’s Ratings Services (“S&P”) and/or Fitch, Inc. (“Fitch”)), and have a minimum principal outstanding of 2 billion euros (or its equivalent) for Sovereign securities and 1 billion euros (or its equivalent) for Sub-Sovereign securities. All bonds entering the Index must have a minimum remaining time to maturity of at least 18 months at the time of each rebalancing. Any bond existing in the Index with a time to maturity of less than 15 months is removed from the Index. The Index is based on a market-value weighting methodology, with limits on the overall weight of any single issuer. German Sovereign debt and debt from the Kreditanstalt fuer Wiederaufbau is capped at 24% of the Index. All remaining issuers are capped with an issuer weight of 4.75%, each as calculated at the time of each rebalancing. The Index is rebalanced and reconstituted quarterly on the last business day of January, April, July and October. As of June 30, 2015, the Index was comprised of 36 component securities, representing debt of 16 German Sovereign and Sub-Sovereign issuers. Approximately 77% of the securities in the Index received the highest rating from each of Moody’s, S&P and Fitch. The Index is published under the Bloomberg ticker symbol “IBXXXZAB.”

The securities that the Fund will principally invest in are set forth below.

- **Debt Securities** – The Fund invests in debt securities of German Sovereign and Sub-Sovereign issuers.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in securities that make up the Index. The Fund may invest in only a representative sample of the securities in the Index or securities not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the government and financial services industry groups and in Germany.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can affect the price of a debt instrument. These factors may cause the value of an investment in the Fund to change.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities typically fluctuates more in response to interest rate changes than securities with shorter maturities. Interest rate risk is generally based on the currency in which the instrument is denominated, in this case the euro.
- **Foreign Currency Risk** – The securities in which the Fund invests will be generally linked to or denominated in the currency of the Federal Republic of Germany, which is currently the euro. Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars or linked to U.S. investments. The value of an investment denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment denominated in a foreign currency, like the investments included in the Index, is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings.
- **Foreign Investments Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index’s performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund’s ability to purchase or sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.
- **Foreign Sovereign Risk** – The Sovereign securities included in the Index are general obligations of the Federal Republic of Germany and are guaranteed by the German federal government. Despite this guarantee, sovereign nations have in the past and may in the future default on, restructure or otherwise change the terms of their debt to the detriment of security holders. Various factors may affect a sovereign’s willingness or ability to repay principal and/or interest in accordance with the terms of the debt, including: its reserves; the relative size of the debt burden on the sovereign’s economy as a whole; or political constraints. If a sovereign defaults on, restructures or otherwise changes the terms of a security held by the Fund, such change may have an adverse impact on the Fund’s returns. In addition, if a sovereign defaults on payments of principal and/or interest, the Fund may have limited legal recourse against the sovereign.
- **Foreign Sub-Sovereign Risk** – Investments in the debt of Sub-Sovereigns (including agency-issued securities) may or may not be issued by or guaranteed as to principal and interest by the German federal government or by the German federal government’s central bank. Certain foreign government securities may be backed by the issuer’s right to borrow from a central bank or other regional banking entity while others may be backed only by the assets and credit of the issuing foreign entity.
- **German Investments Risk** – Germany, as a member of the European Union, may be significantly affected by EU policies and may be highly dependent on the economies of its fellow members. The

European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of debt issued by issuers in European countries, including Germany, to fall (in some cases drastically) and may cause further volatility in the European financial markets, either of which may negatively impact the Fund's returns.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards, and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Furthermore, the Fund's currency holdings may be valued at a different time than the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Financial Services Industry Risk** – The Fund is subject to risks faced by companies in the financial services economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financial sector.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in Germany, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Germany and, to a certain extent, the European Union and subject to the risks related thereto.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because

the Fund and the Index generally value such securities as of their local market closing time, the daily net asset value (“NAV”) and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers to have a greater impact on the Fund’s performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund’s investment exposure. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31

Best Quarter (ended 9/30/2013): 4.27%

Worst Quarter (ended 9/30/2014): -6.40%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -8.56%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-6.73%	0.76%	1/24/2012
After Taxes on Distributions	-7.03%	0.23%	—
After Taxes on Distributions and Sale of Shares	-3.79%	0.37%	—
Markit iBoxx EUR Germany Sovereign & Sub-Sovereign Liquid Index <sup>#</sup>	-6.18%	1.42%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since January 2012.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares

on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, monthly, and capital gains, if any, at least annually.

## Investment Objective

ProShares Short Term USD Emerging Markets Bond ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the DB Short Duration Emerging Market Bond Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.50%
Other Expenses	1.27%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

	<b>1.77%</b>
Fee Waiver/Reimbursement*	-1.27%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.50%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.50% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$51	\$433	\$840	\$1,979

The Fund pays transaction costs associated with the purchase and sale of securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 106% of the average value of its entire portfolio.

## Principal Investment Strategies

The Index (Bloomberg Ticker: “DBEMPRO”) is comprised of a diversified portfolio of USD-denominated Emerging Market bonds that have less than or equal to five years remaining to maturity (“Short Term USD EM Bonds”) that are issued by Emerging Market sovereign governments (“Sovereigns”), non-sovereign government agencies and entities (“Sub-Sovereigns”), and corporations with significant government ownership (“Quasi-Sovereigns”). Those countries qualifying as “Emerging Markets” are determined by the index provider; as of June 30, 2015, the Index included 155 bonds from 55 issuers from Sovereigns or other qualifying entities domiciled in 23 such countries. These countries were: Brazil, Colombia, Croatia, El Salvador, Hungary, Indonesia, Latvia, Lithuania, Mexico, Pakistan, Panama, Peru, Philippines, Poland, Qatar, Russia, Serbia, Slovenia, South Africa, Sri Lanka, Turkey, Ukraine and Venezuela.

The Index is designed to represent the more liquid universe of Short Term USD EM Bonds. The bonds eligible for inclusion in the Index are expected to include those issued by Emerging Market Sovereigns, Sub-Sovereigns and Quasi-Sovereigns that: (1) are fixed rate; and (2) have between zero and five years to maturity. Eligible bonds will also have a minimum face amount outstanding of \$500 million. Callable, puttable, zero coupon, inflation-linked and convertible bonds, among others, will be excluded. The Index includes both investment grade and below investment grade rated (i.e. “high yield”) securities and will include bonds, in the aggregate, that have a dollar weighted average years-to-maturity of three years or less.

The Index maintains certain issuer weight caps for diversification purposes, including limiting the weights of issuers from any particular country to no more than ten percent (10%) of the Index. The Index is reconstituted and rebalanced on a quarterly basis; cash from maturing issues or coupon payments is reinvested monthly.

As of June 30, 2015, the Index was composed of approximately 155 bonds from approximately 54 different issuers.

For a further description of the Index, please see “Description of the Index” in the back of the Fund’s Full Prospectus.

The Fund invests in debt securities that ProShare Advisors believes should track the performance of the Index. The Fund, under normal circumstances, seeks to remain fully exposed to the Index and will invest at least 80% of its total assets in securities of the Index.

The Fund will principally invest in:

- **Debt Securities** – The Fund invests in U.S. dollar-denominated debt securities issued by Sovereign, Sub-Sovereign or Quasi-Sovereign issuers deemed to be domiciled in “Emerging Markets” by the index provider that are offered for sale in the United States. Because the debt securities are U.S. dollar-denominated, fluctuations in currency exchange rates will not directly affect the principal or coupons associated with the debt securities.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of securities that make up the Index. The Fund may invest in only a representative sample of the securities in the Index or in securities not contained in the Index, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities based on ProShare Advisors' view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund.

The Fund seeks to remain fully invested at all times in securities that provide exposure to the Index without regard to market conditions, trends, or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in Eastern Europe, Latin America and Asia.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Debt Instrument Risk** – The Fund invests in debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. These factors may cause the value of an investment in the Fund to change.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities. Interest rates generally operate based on the currency in which the instrument is denominated, in this case the U.S. dollar.
- **High Yield Risk** – Exposure to high yield (lower rated) debt instruments (also known as "junk bonds") may involve greater levels of credit, liquidity and valuation risk than for higher rated instruments. High yield debt instruments may be more sensitive to economic changes, political changes, or adverse developments specific to a government or company than other fixed income instruments. These securities are subject to greater risk of loss, greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market for securities. High yield debt instruments are considered speculative with respect to the issuer's continuing

ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than higher rated debt instruments. An economic downturn or period of rising interest rates could adversely affect the market for these securities and reduce market liquidity (liquidity risk). Less active markets may diminish the Fund's ability to obtain accurate market quotations when valuing the portfolio securities and thereby give rise to valuation risk. If the issuer of a security is in default with respect to interest or principal payments, the issuer's security could lose its entire value. Furthermore, the transaction costs associated with the purchase and sale of high yield debt instruments may vary greatly depending upon a number of factors and may adversely affect the Fund's performance.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency, which could adversely affect the ability of an issuer to pay principal and interest on a bond. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Foreign Sovereign Risk** – The Sovereign securities included in the Index are general obligations of the governments of certain emerging market countries and are guaranteed by the central banks of such countries. Despite this guarantee, sovereign nations have in the past and may in the future default on, restructure or otherwise change the terms of their debt to the detriment of security holders. Various factors may affect a sovereign's willingness or ability to repay principal and/or interest in accordance with the terms of the debt, including: its reserves; the relative size of the debt burden on the sovereign's economy as a whole; or political constraints. If a sovereign defaults on, restructures or otherwise changes the terms of a security held by the Fund, such change may have an adverse impact on the Fund's returns. In addition, if a sovereign

defaults on payments of principal and/or interest, the Fund may have limited legal recourse against the sovereign. In the past, certain governments of emerging market countries have declared themselves unable to meet their financial obligations on a timely basis, which has resulted in losses to the holders of such debt.

- **Foreign Sub-Sovereign and Quasi-Sovereign Risk** – Investments in the debt of Sub-Sovereigns (including agency-issued securities) and Quasi-Sovereigns (i.e., corporations that have significant government ownership) may or may not be issued by or guaranteed as to principal and interest by a governmental authority. Certain foreign government securities may be backed by the issuer's right to borrow from a central bank or other regional banking entity while others may be backed only by the assets and credit of the issuing foreign entity. If an issuer of Sub-Sovereign or Quasi-Sovereign bonds defaults on payments of principal and/or interest, the Fund may have limited recourse against the issuer.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of debt issued by companies in European Countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, which may negatively impact the Fund's returns.

Recent events in the Russian Federation may have an adverse impact on the Fund. In response to related political and military actions by Russia, the United States and the European Union have instituted numerous sanctions against certain Russian officials and Bank Rossiya. These sanctions, and other intergovernmental actions that may be undertaken against Russia in the future, may cause a decline in the value and liquidity of securities offered by Russian issuers. Future sanctions could, among other actions, directly target transactions in Russian securities, impairing the ability of the Fund to buy, sell, receive, deliver, or obtain exposure to, those securities.

In addition, the Fund is exposed to risks associated with investments in Latin America, including, but not limited to: i) political, economic, or social instability in certain Latin American countries; ii) a heightened risk of high inflation and government deficits in certain Latin American countries; iii) natural disasters particularly likely to happen in Latin America; iv) heightened risk of currency devaluations; v) risks associated with Latin American economies' significant

dependence on the health of the U.S. economy; and vi) risks associated with Latin American economies' sensitivity to fluctuations in the price of commodities such as oil and gas, minerals and metals (resulting from those economies' heavy reliance on the export of such commodities).

- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there can be no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. This may be due, in many cases, to the impact of a limited trading market in the component Index bonds on the calculation of the Index. Other factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities may be restricted, which may result in the Fund being unable to buy or sell certain securities. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities and other instruments

correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily net asset value ("NAV") and Index performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Because of the nature of Short Term USD EM Bonds, shares may typically trade at a larger premium or discount to the value of the Fund's holdings than shares of many other ETFs. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to

manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains. Such activity may have a particularly significant impact on funds (like the Fund) that seek long exposure to Short Term USD EM Bonds.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

As a result, the performance of the Fund may vary, perhaps significantly, from the performance of the Index.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund's investment results during its first full calendar year of operations, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2014): 2.74%

Worst Quarter (ended 12/31/2014): -4.11%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 3.73%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-2.42%	-1.45%	11/19/2013
After Taxes on Distributions	-4.16%	-3.18%	—
After Taxes on Distributions and Sale of Shares	-1.33%	-1.84%	—
DB Short Duration Emerging Market Bond Index <sup>#</sup>	-2.07%	-1.01%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since November 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, monthly, and capital gains, if any, at least annually.

## Investment Objective

ProShares Hedge Replication ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Merrill Lynch Factor Model–Exchange Series (the “Benchmark”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.31%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.06%</b>
Fee Waiver/Reimbursement*	-1.11%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$538	\$1,006	\$2,301

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 164% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should track the performance of the Benchmark. The Benchmark, established by Merrill Lynch International, seeks to provide the risk and return characteristics of the hedge fund asset class by targeting a high correlation to the HFRI Fund Weighted Composite Index (the “HFRI”). The HFRI is designed to reflect hedge fund industry performance through an equally weighted composite of over 2000 constituent funds. In seeking to maintain a high correlation with the HFRI, the Benchmark utilizes a systematic model to establish, each month, weighted long or short (or, in certain cases, long or flat) positions in six underlying factors (“Factors”). The Factors that comprise the Benchmark are (1) the S&P 500 Total Return Index, (2) the MSCI EAFE US Dollar Net Total Return Index, (3) the MSCI Emerging Markets US Dollar Net Total Return Index, (4) the Russell 2000 Total Return Index, (5) three-month U.S. Treasury Bills, and (6) the ProShares UltraShort Euro ETF. The Benchmark is not comprised of, and the Fund does not invest in, any hedge fund or group of hedge funds. The Benchmark is published under the Bloomberg ticker symbol “MLEIFCTX.” It is expected that, at any given point in time, the Fund will be substantially invested in three-month U.S. Treasury Bills, which is one of the Factors, or other short-term debt instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles in order to gain exposure to the three-month U.S. Treasury Bill rate.

Because the levels of certain Factors of the Benchmark are not determined at the same time that the Fund’s NAV is calculated, correlation to the Benchmark is measured by comparing a combination of the daily total return of: (a) the Factors that are determined at the same time that the Fund’s NAV is determined; and (b) one or more U.S. exchange-traded securities or financial instruments that reflect the values of the Factors that are not determined at the same time that the Fund’s net asset value (“NAV”) is determined (as of the Fund’s NAV calculation time), to the daily total return of the NAV per share of the Fund.

For a further description of the Benchmark, please see “Additional Information on Certain Underlying Indexes” in the back of the Fund’s Full Prospectus.

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including

exchange-traded funds (“ETFs”), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in or making short sales of the securities underlying the Benchmark. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.
- **Depository Receipts** – The Fund may invest in depository receipts, which principally include
  - American Depositary Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - Global Depositary Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Benchmark. The Fund attempts to track the performance of the Benchmark by investing all, or substantially all, of its assets in investments that make up the Benchmark or in financial instruments that provide similar exposure. The Fund may invest in or gain exposure to only a representative sample of the securities that comprise the Factors of the Benchmark or securities not contained in the Benchmark or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Benchmark. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in

securities (including three-month U.S. Treasury Bills and other money market instruments) and/or financial instruments that, in combination, provide exposure to the Benchmark without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Factors of the Benchmark are so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps, futures and forwards on the Benchmark or an underlying Factor and swaps, futures and forwards on an ETF that is designed to track the performance of an underlying Factor. The performance of an ETF may not track the performance of an underlying Factor due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps, futures and forwards that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Benchmark or an underlying Factor as it would if the Fund only used swaps, futures and forwards on the Benchmark or an underlying Factor. Moreover, with respect to the use of swap agreements, if the Benchmark or underlying factor has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Benchmark or an underlying Factor reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- **Long/Short Risk** – The Fund seeks long exposure to certain Factors and short exposure to certain other Factors. There is no guarantee that the returns on the Fund’s long or short positions will produce high, or even positive, returns and the Fund could lose money if either or both the Fund’s long and short positions produce negative returns.

- Benchmark Performance Risk** – There is no guarantee or assurance that the methodology used to create the Benchmark will result in the Fund achieving high, or even positive, returns. The Benchmark may underperform more traditional indices. In turn, the Fund could lose value while the levels of other indices or measures of market performance increase. The Benchmark does not in any way represent a managed hedge fund or group of hedge funds, and there is no guarantee that it will achieve returns correlated with any hedge fund, group of hedge funds, or the HFRI. Neither ProShare Advisors nor Merrill Lynch International has any control over the composition or compilation of the HFRI, and there is no guarantee that the HFRI will continue to be produced.
- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Benchmark, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Benchmark include fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. In addition, on each trading day, the closing levels of the Factors that comprise the Benchmark are, in certain cases, calculated earlier or later than the time of valuation for the Fund. The Fund may not have investment exposure to all Factors in the Benchmark or the securities comprising these Factors and its weighting of investment exposure to Factors may be different from that of the Benchmark. In addition, the Fund may invest in securities not included in the Benchmark or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Benchmark. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or under-exposed to the Benchmark and may be impacted by Benchmark reconstitutions and Benchmark rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Benchmark and may hinder the Fund's ability to meet its investment objective.
- Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument.
 

These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Any credit event may also adversely impact the financial markets.
- Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Benchmark may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with

increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Benchmark.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities or derivatives (and/or reference assets on which the derivatives are based) held by the Fund, however, may be traded in markets that close at different time than NYSE Arca. Consequently, liquidity in the securities or derivatives (and/or their reference assets) may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing, fixing or settlement times, trading spreads and the resulting premium or discount on the Fund's shares may widen. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large

discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming shares directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or "short" exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- Small- and Mid-Cap Company Investment Risk** – The Benchmark and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
- Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next would be the case than if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). The closing levels of the Factors that comprise the Benchmark are, in certain cases, calculated earlier or later than the time the Fund typically values its portfolio. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the performance of the Benchmark.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 2.30%

Worst Quarter (ended 6/30/2012): -1.88%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 1.79%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	0.90%	1.56%	7/12/2011
After Taxes on Distributions	0.90%	1.56%	—
After Taxes on Distributions and Sale of Shares	0.51%	1.20%	—
Merrill Lynch Factor Model—Exchange Series <sup>#</sup>	2.31%	2.58%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Benchmark. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Benchmark.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer.

Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### **Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Investment Objective

ProShares Merger ETF (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the S&P Merger Arbitrage Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	4.19%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>4.94%</b>
Fee Waiver/Reimbursement*	-4.19%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.75%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.75% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$77	\$1,107	\$2,139	\$4,724

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when Fund shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 332% of the average value of its entire portfolio. The Fund’s portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund is designed to track the performance of the Index and provide exposure to a global merger arbitrage strategy. The Index, and by extension the Fund, seeks to produce consistent, positive returns in virtually all market environments, although there are no assurances it will achieve this result. A global merger arbitrage strategy seeks to capture the spread between the price at which the stock of a company (each such company, a “Target”) trades after a proposed acquisition of such Target is announced and the value (cash plus stock) that the acquiring company (the “Acquirer”) has proposed to pay for the stock of the Target (a “Spread”). Such a Spread typically exists due to the uncertainty that the announced merger, acquisition or other corporate reorganization (each, a “Deal”) will close, and if it closes, that such Deal will be at the initially proposed economic terms. For Deals that close, the price of the Target after the Deal is announced is expected to approach the proposed acquisition price by the closing date of the Deal, resulting in a gain to strategies such as the Index’s, which attempt to capture this Spread. The size of the Spread will depend on several factors, including the perceived risk of the Deal closing and the length of time expected until the Deal is completed. For Deals that are not consummated, the price of the Target commonly falls back to pre-announcement levels, typically resulting in significant losses well in excess of the post-announcement Spread the strategy attempts to capture.

To obtain exposure to the Index, the Fund takes long positions in shares of the Target. The Fund also takes short positions in shares of the Acquirer when the Deal involves an exchange of the Acquirer’s stock. The short positions are intended to reduce the effect that declines in the value of the Acquirer’s stock could have on the Spread.

The Index, created by Standard & Poor’s®, provides exposure to up to 40 publicly announced Deals within developed market countries through a combination of long and, in certain cases, short security positions. When Deals enter the Index, the weight in long positions of Targets is initiated at three percent (3%) and the initial weight in short positions of Acquirers ranges between zero and three percent (0% and 3%), depending on the terms of the Deal. The sum of initial net exposure for the Fund (i.e., the difference between: (a) the Fund’s total long exposure; and (b) the Fund’s total short exposure) is limited to between zero and one hundred percent (0% and 100%), with both the long and short positions having a maximum initial exposure each of 120%. The Index also includes a Treasury bill component which constitutes the remainder of the Index when net exposure from included Deals is less than 100%. Certain Deals are screened out based on liquidity, size, and Spread between the Deal price and the Target’s stock price. Additions and deletions occur on a rolling basis. Returns are expected to be uncorrelated to equity markets over time.

The Index is denominated in local currencies, and the Fund will generally seek to hedge against the impact of currency movements. The Index is published under the Bloomberg ticker symbol “SPLSALT”.

For a further description of the Index, please see “Additional Information on Certain Underlying Indexes” in the back of the Fund’s Full Prospectus.

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should track the performance of the Index. Under normal circumstances, the Fund will invest at least 80% of its total assets in component securities (i.e., securities of the Index). The Fund will generally not short any stocks directly but will generally obtain short exposure through derivatives. The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by U.S. and foreign public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), exchange rate, interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in or making short sales of the securities of the Index, as well as for effecting currency hedging transactions. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Forward Contracts** – Two-party contracts where a purchase or sale of a specific quantity of a commodity, security, foreign currency or other financial instrument is entered into with dealers or financial institutions at a set price, with delivery and settlement at a specified future date. Forward contracts may also be structured for cash settlement, rather than physical delivery.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified

time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in investments that make up the Index or in financial instruments that provide similar exposure, holding or exposed to each investment in approximately the same proportion as its weighting in the Index. At times, the Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of securities that make up the Index or gaining exposure to the securities that make up the Index, in approximately the same proportion as their weighting in the Index, at times, the Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Furthermore, the Fund's currency holdings may be valued at a different time than the level of the Index. The Fund's foreign currency hedging strategy may also be unable to perfectly match the Index and will introduce additional costs, both sources of additional correlation risk. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- Risks Related to Foreign Currencies and the Fund's Currency Hedging Strategy** – The Index is denominated in local currencies and does not reflect the impact of currency movements that can affect U.S. investors (such as the Fund) in such securities. The Fund will generally attempt to match the Index by hedging against exposure to foreign currencies. These hedges will in many cases not fully eliminate the exposure to a particular currency. In addition, interest rate differentials and additional transaction costs can diminish the effectiveness of a particular hedging position. All of these factors may cause additional correlation risk. In addition, in order to transact in foreign investments, the Fund may exchange and hold foreign currencies. Regulatory fees or higher custody fees may be imposed on foreign currency holdings.
- Foreign Investments Risk** – Investments in securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Index's performance, such as: i) fluctuations in the value of the applicable foreign currency; ii) differences in securities settlement practices; iii) uncertainty associated with evidence of ownership of investments in countries that lack centralized custodial services; iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; v) potentially higher brokerage commissions; vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; vii) taxation of income earned in foreign countries or other foreign taxes imposed; viii) foreign exchange controls, which may include suspension of the ability to transfer currency from a foreign country; ix) less publicly available information about foreign issuers; x) changes in the denomination currency of a foreign investment; and xi) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to purchase or sell foreign investments at appropriate times. Because of differences in settlement times and/or foreign market holidays, transactions in a foreign market may take place one or more days after the necessary exposure to these investments is determined. Until the transactions are effected, the Fund is exposed to increased foreign currency risk and market risk and, ultimately, increased correlation risk.
- Risks Related to the Merger Arbitrage Strategy** – There is no assurance that any of the Deals reflected in the Index will be successfully completed. In particular, in certain market conditions, it is possible that most or all of the Deals could fail. If any Deal reflected in the Index is not consummated, the Spread between the price offered for the Target and the price at which the shares of the Target trade is expected to widen. In such cases the price of the Target commonly falls back to pre-Deal announcement levels, typically resulting in significant losses well in excess of the post-announcement Spread the strategy attempts to capture. This could adversely affect the performance of the Index and the performance of the Fund. Deals may be terminated, renegotiated, or subject to a longer time frame than initially contemplated due to business, regulatory, or other concerns. Any of these events may negatively impact the performance of the Fund. The Index may also delete transactions under certain circumstances, thus precluding any potential future gains. Also, foreign companies involved in pending mergers or acquisitions may present risks distinct from comparable transactions completed solely within the U.S.
- Long/Short Risk** – The Fund seeks long exposure to certain securities and short exposure to certain other securities. There is no guarantee that the returns on the Fund's long or short positions will produce high, or even positive, returns and the Fund could lose money if either or both the Fund's long and short positions produce negative returns.

- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, the cost of shorting securities, which is not reflected in the Index, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund. The Fund may not have exposure to all short components of the Index or may have short exposure to securities not included in the Index.
- Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments or repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- Index Performance Risk** – There is no guarantee or assurance that the methodology used to create the Index will result in the Fund achieving high, or even positive, returns. The Index may underperform more traditional indices. In turn, the Fund could lose value while other indices or measures of market performance increase in value.
- Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- Market Price Variance Risk** – The Fund’s shares are listed for trading on the BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund and the Index generally value such securities as of their local market closing time, the daily net asset value (“NAV”) and Index performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible

to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31

Best Quarter (ended 9/30/2013): 0.85%

Worst Quarter (ended 3/31/2013): -3.94%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.19%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-2.82%	-3.04%	12/11/2012
After Taxes on Distributions	-2.98%	-3.50%	—
After Taxes on Distributions and Sale of Shares	-1.47%	-2.42%	—
S&P Merger Arbitrage Index*	-1.19%	-1.48%	—

\* Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at

NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### **Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually.

## Investment Objective

ProShares RAFI™ Long/Short (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the RAFI™ US Equity Long/Short Index (the “Index”).

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.42%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.17%</b>
Fee Waiver/Reimbursement*	-0.22%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$350	\$622	\$1,401

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 65% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should track the performance of the Index. The Index (Bloomberg Ticker: “RAFILS”) allocates an aggregate equal dollar amount to both long and short equity positions. This allocation is based on a comparison of Research Affiliates Fundamental Index® weightings with traditional market capitalization weightings. The Index methodology seeks to capitalize on a theory that traditional index weighting based on market capitalization results in overweighting of over-priced securities and underweighting of under-priced securities.

For a further description of the Index, please see “Additional Information on Certain Underlying Indexes” in the back of the Fund’s Full Prospectus.

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in or taking short positions in the equity securities comprising the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in investments that make up the Index or in financial instruments that provide similar exposure. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on

ProShare Advisors' view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- **Long/Short Risk** – The Fund seeks long exposure to certain securities and short exposure to certain other securities. There is no guarantee that the returns on the Fund's long or short positions will produce high, or even positive, returns and the Fund could lose money if either or both the Fund's long and short positions produce negative returns.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation with the Index include fees, expenses, transaction costs, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities or financial instruments not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Index Performance Risk** – There is no guarantee or assurance that the methodology used to create the Index will result in the Fund achieving high, or even positive, returns. The Index may underperform more traditional indices. In turn, the Fund could lose value while other indices or measures of market performance increase in value. In addition, the Index was formed in November 2010. Accordingly, the Index has limited historical performance.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare

Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily net asset value (“NAV”) of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund’s investment exposure. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility

and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2012): 5.50%

Worst Quarter (ended 9/30/2011): -5.96%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -3.30%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	0.38%	2.48%	12/2/2010
After Taxes on Distributions	0.08%	2.25%	—
After Taxes on Distributions and Sale of Shares	0.47%	1.94%	—
RAFI U.S. Equity Long/Short Index <sup>#</sup>	1.54%	3.76%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually.

## Investment Objective

ProShares 30 Year TIPS/TSY Spread (the “Fund”) seeks investment results, before fees and expenses, that track the performance of the Credit Suisse 30-Year Inflation Breakeven Index (the “Index”).

Unlike many traditional bond funds, the Fund is not designed to provide a steady stream of income.

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.55%
Other Expenses	3.13%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.68%</b>
Fee Waiver/Reimbursement*	-2.93%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.75%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.75% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$77	\$854	\$1,652	\$3,741

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may

result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 110% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund, under normal circumstances, seeks to remain fully exposed to the Index and will invest at least 80% of its total assets in securities of the Index. In addition, the Fund will invest in derivatives and other fixed income securities that ProShare Advisors believes, in combination, should track the performance of the Index. The Index tracks the performance of long positions in the most recently issued 30-year Treasury Inflation-Protected Securities (“TIPS”) bond and duration-adjusted short positions in U.S. Treasury bonds of the closest maturity. The difference in yield (or “spread”) between these bonds (Treasury yield minus TIPS yield) is commonly referred to as a “breakeven rate of inflation” (“BEI”). **The 30-Year BEI is considered to be a measure of the market’s expectations for inflation over the next thirty years.** The Index (and the Fund) is designed to appreciate as the BEI increases. An increase in the BEI occurs if: (1) the yield on Treasuries rises (i.e., the price of the Treasuries decreases) relative to the yield on TIPS; or (2) the yield on TIPS falls (i.e., the price of the TIPS increases) relative to the yield on Treasuries. Conversely, the Index (and the Fund) is designed to depreciate if the BEI decreases. A decrease in the BEI occurs if: (1) the yield on Treasuries falls (i.e., the price of the Treasuries increases) relative to the yield on TIPS; or (2) the yield on TIPS rises (i.e., the price of the TIPS decreases) relative to the yield on Treasuries. The level of the Index (and the Fund) will fluctuate based on changes in the value of the underlying bonds, which likely will not be the same on a percentage basis as changes in the BEI. **The Index is not designed to measure the realized rate of inflation, nor does it seek to replicate the returns of any index or measure of actual consumer price levels.** The Index is published under the Bloomberg ticker symbol “CSTYIN30.”

The securities and financial instruments that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **U.S. Treasury Securities** – The Fund has exposure to securities issued by the U.S. Treasury, in particular the following:
  - **U.S. Treasury Inflation-Protected Securities** – The Fund generally takes long positions (or obtains long exposure via derivatives, as further described below) in U.S. Treasury Inflation-Protected Securities, or TIPS, which are inflation-protected public obligations of the U.S. Treasury. TIPS are income-generating instruments whose interest and principal payments are adjusted for inflation—a sustained increase in prices that erodes the purchasing power of money. The inflation adjustment, which is typically applied

monthly to the principal of the bond, follows a designated inflation index, such as the consumer price index. A fixed coupon rate is applied to the inflation-adjusted principal so that as inflation rises, the values of both the principal and the interest payments increase. This can provide investors with a hedge against inflation, as it helps preserve the purchasing power of an investment. Because of this inflation adjustment feature, inflation-protected bonds typically have lower yields than conventional fixed-rate bonds.

- **U.S. Treasury Bonds** – The Fund generally takes short positions (or obtains short exposure via derivatives, as further described below) in U.S. Treasury bonds, which are public obligations of the U.S. Treasury that pay a fixed coupon and have a maturity of twenty or more years.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in or making short sales of the fixed income securities underlying the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors follows a passive approach to investing that is designed to track the performance of the Index. The Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in investments that make up the Index or in financial instruments that provide similar exposure, holding or exposed to each investment in approximately the same

proportion as its weighting in the Index. At times, the Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security or instrument, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to the Index without regard to market conditions, trends or direction.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- **Breakeven Inflation Investing Risk** – The Index tracks the performance of long positions in the most recently issued Treasury Inflation-Protected Securities (TIPS) bond of a particular maturity and duration-adjusted short positions in U.S. Treasury bonds of the closest maturity. The difference in yield (or spread) between these bonds (Treasury yield minus TIPS yield) is commonly referred to as a breakeven rate of inflation (“BEI”) and is considered to be a measure of the market’s expectations for inflation over the relevant period. The level of the Index (and the Fund) will fluctuate based on changes in the value of the underlying bonds, which will likely not be the same on a

percentage basis as changes in the BEI. The Index is not designed to measure or predict the realized rate of inflation, nor does it seek to replicate the returns of any price index or measure of actual consumer price levels. Changes in the BEI are based on the TIPS and U.S. Treasury markets, interest rate and inflation expectations, and fiscal and monetary policy. There is no guarantee that these factors will combine to produce any particular directional changes in the Index over time, or that the Fund will retain any appreciation in value over extended periods of time, or that the returns of the Index or the Fund will track or outpace the realized rate of inflation, or any price index or measure of actual consumer price levels. It is possible that the returns of the Index or the Fund will not correlate to (or may be the opposite of) the change in the realized rate of inflation, or any price index, or measure of actual consumer price levels. Furthermore, while the BEI provides exposure to inflation expectations, it may also be influenced by other factors, including premiums related to liquidity for certain bonds as well as premiums surrounding the uncertainty of future inflation. These other factors may impact the level of the Index or the value of the Fund in unexpected ways and may cancel out or even reverse the impact of changes in inflation expectations. As a result, an investment in the Fund may not serve as an effective hedge against inflation.

- **Fixed Income and Market Risk** – The TIPS and U.S. Treasury markets can be volatile, and the value of securities, swaps, futures, and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets, such as the TIPS and U.S. Treasury markets, are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the TIPS and U.S. Treasury markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income or inflation-linked investments.
- **Index Performance Risk** – There is no guarantee or assurance that the methodology used to create the Index will result in the Fund achieving high, or even positive, returns, or that the Fund will retain any appreciation in value over extended periods of time. The Index may underperform more traditional indices. In turn, the Fund could lose value while other indices or measures of market performance increase in value. In addition, the Index was formed in November 2011. Accordingly, the Index has limited historical performance. In addition, the Index adjusts its positions on a daily basis to maintain duration neutrality between its TIPS and Treasury positions. As such, its performance will not reflect the performance of an unadjusted equivalent investment in long TIPS and short Treasury securities over a period of time greater than a single day. Because the Index adjusts its positions to maintain duration neutrality at or about the time of the Fund's net asset value ("NAV") calculation, when the Fund's shares are bought intraday, such shares are unlikely to be duration neutral.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective. The factors that may adversely affect the Fund's correlation to the Index include fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards, and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the types of securities that make up the Index or gaining exposure to the securities that make up the Index, in approximately the same proportions as their weightings in the Index, at times the weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its investment objective.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments or repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Long/Short Risk** – The Fund seeks long exposure to certain securities and short exposure to certain other securities. There is no guarantee that the returns on the Fund's long or short positions will produce high, or even positive, returns and the Fund could lose money if either or both the Fund's long and short positions produce negative returns. In addition, the Fund may gain enhanced long exposure to certain securities (i.e., obtain investment exposure that exceeds the amount directly invested in those assets, a form of leverage) and, under such circumstances, will lose more money in market environments that are adverse to its long positions than funds that do not employ such leverage. As a result, such investments may give rise to losses that exceed the amount invested in those assets.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31

Best Quarter (ended 9/30/2013): 2.42%

Worst Quarter (ended 6/30/2013): -7.61%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 0.47%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-13.59%	-6.69%	1/10/2012
After Taxes on Distributions	-14.02%	-7.16%	—
After Taxes on Distributions and Sale of Shares	-7.66%	-5.16%	—
Dow Jones Credit Suisse 30-Year Inflation Breakeven Index/Credit Suisse 30-Year Inflation Breakeven Index <sup>#</sup>	-12.33%	-5.47%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since January 2012.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Investment Objective

ProShares CDS North American HY Credit ETF (the “Fund”) seeks to provide long exposure to the credit of North American high yield debt issuers.

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.65%
Other Expenses	1.04%

### Total Annual Operating Expenses Before Fee

<b>Waivers and Expense Reimbursements</b>	<b>1.69%</b>
Fee Waiver/Reimbursement*	-1.19%

### Total Annual Operating Expenses After Fee

<b>Waivers and Expense Reimbursements</b>	<b>0.50%</b>
---	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.50% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$51	\$416	\$806	\$1,898

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. The Fund’s portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If these transactions were included, the Fund’s portfolio turnover rate would be significantly higher. During the period from August 5, 2014 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 0% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund seeks to achieve its investment objective primarily through investing in a portfolio of credit derivatives whose underlying reference entities are North American high yield (i.e., below investment grade or “junk bond”) debt issuers. Under normal circumstances, the Fund will invest at least 80% of its net assets in centrally cleared, index-based credit default swaps (“CDS”) that, in combination, should have economic characteristics that correlate to the North American high yield credit market. For these purposes, investments in centrally cleared, index-based CDS include not only the amounts associated with direct investments in the CDS but also cash and cash equivalents that are segregated on the Fund’s books and records or are being used as collateral or otherwise available to cover the investment exposure associated with the CDS.

ProShare Advisors will actively manage the Fund, selecting credit derivatives based on the following primary considerations:

- **Diversification** – maintaining broadly diversified exposure to the credit of North American high yield debt issuers;
- **Liquidity** – favoring credit derivatives with greater relative liquidity; and
- **Sensitivity to Changes in Credit Quality** – generally favoring credit derivatives having greater sensitivity to changes in credit quality.

ProShare Advisors may, at times, also consider other factors such as the relative value of one credit derivative versus another.

The Fund seeks to increase in value as the overall North American high yield credit market improves (i.e., the likelihood of payment by North American high yield debt issuers increases), while also seeking to limit the impact of a change in the credit quality of any single high yield debt issuer.

Credit markets are commonly considered to be improving when credit spreads (i.e., the level of additional yield that is paid on corporate bonds as compared to Treasury securities) are generally decreasing.

The use of CDS to obtain long credit exposure is also expected to generate ordinary income.

The derivatives and securities that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in very short-term money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund primarily invests in derivatives to obtain long exposure to North American high yield credit. These derivatives principally include:

- **Credit Default Swaps (CDS)** – The Fund intends to primarily invest in centrally cleared, index-based CDS. CDS provide exposure to the credit of one or more debt issuers referred to as “reference entities.” These instruments are designed to reflect changes in credit quality, including events of default. CDS are most commonly discussed in terms of buying or selling credit protection with respect to a reference entity. Selling credit protection is equivalent to being “long” credit. Because the Fund seeks to provide long exposure to credit, it will generally be a net seller of credit protection with respect to North American high yield debt issuers. Index-based CDS provide credit exposure, through a single trade, to a basket of reference entities. A variety of high yield, index-based CDS with different characteristics are currently available in the marketplace with new issuances occurring periodically. Issuances typically vary in terms of underlying reference entities and maturity and, thus, can have significant differences in performance over time.

For North American high yield, index-based CDS, there are typically new issuances every six months of 5.25 year maturity swap on a 100-name basket, which names vary from issue to issue. Older issues have remaining maturities of up to 4.75 years.

- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles. Under normal circumstances, the Fund’s investments in such instruments will, in aggregate, maintain a weighted average maturity of three months or less. Such money market instruments include:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the United States.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

The Fund seeks to remain fully invested (i.e., will not take defensive positions). As such, the Fund should be expected to decrease in value when overall North American high yield credit markets deteriorate. Credit markets are commonly considered to be deteriorating when credit spreads (i.e., the level of additional yield that is paid on corporate bonds as compared to Treasury securities) are generally increasing.

The Fund will seek to obtain only non-leveraged long credit exposure (i.e., exposure equivalent to Fund assets).

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in securities. These risks include counterparty risk and liquidity risk (each as discussed below). Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- **Credit Default Swap (CDS) Risk** – The Fund will normally be a net seller of credit protection on North American high yield debt issuers through index-based CDS. Upon the occurrence of a credit event, the Fund will have an obligation to pay the full notional value of a defaulted reference entity less recovery value. Recovery values for CDS are generally determined via an auction process to determine the final price for a given reference entity. Although the Fund intends, as practicable, to obtain initial exposure primarily through centrally cleared CDS, an active market may not exist for any of the CDS in which the Fund invests or in the reference entities subject to the CDS. As a result, the Fund’s ability to maximize returns or minimize losses on such CDS may be impaired. Other risks of CDS include difficulty in valuation due to the lack of pricing transparency and the risk that changes in the value of the CDS do not reflect changes in the credit quality of the underlying reference entities or may otherwise perform differently than expected given market conditions.
- **High Yield Credit Risk** – Exposure to high yield (or “junk”) credit may involve greater levels of credit, liquidity and valuation risk than for higher rated instruments. High yield credit may be more sensitive to economic changes, political changes, or adverse developments specific to a company than other types of credit. High yield credit is also subject to greater risk of loss, greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market. High yield credit is considered predominantly speculative with respect to the issuer’s continuing ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than other types of credit. An economic downturn or period of rising yields could adversely affect the market for high yield credit and reduce market liquidity (liquidity risk). Less active markets may diminish the Fund’s ability to obtain accurate market quotations when valuing high yield credit and thereby give rise to valuation risk.
- **Active Management Risk** – The performance of actively managed funds reflect, in part, the ability of ProShare Advisors to select investments and make investment decisions that are suited to achieving the Fund’s investment objective. ProShare Advisors’ judgments about the Fund’s investments may prove to be incorrect. If the investments selected and strategies employed

by the Fund fail to produce the intended results, the Fund could underperform other funds with a similar investment objective and/or strategies.

- **Counterparty Risk** – While the instruments the Fund will use will be centrally cleared, the Fund will still be subject to credit risk with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of your investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the North American high yield credit market.
- **Market Risk** – The Fund is subject to market risks that will affect the value of its shares, including adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Volatility in the market and/or market developments may cause the value of an investment in the Fund to decrease.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund generally values such securities as of the bond market closing time, the daily NAV performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Because of the nature of the high yield credit market, shares may typically trade at a larger premium or discount to the value of the Fund's holdings than shares of many other ETFs. The Fund's investment results are measured based upon the daily net asset value ("NAV") of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – In seeking to meet its investment objective, the Fund may incur high portfolio turnover to manage the Fund's investment exposure. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Tax Risk** – In order to qualify for treatment as a regulated investment company for federal income tax purposes, the Fund must derive at least 90% of its gross income for each taxable year from "qualifying income," meet certain asset diversification tests at the end of each taxable quarter, and distribute annually to its shareholders at least 90% of its ordinary income and realized net short-term capital gains. The tax treatment of certain swaps, such as CDS, is unclear in several respects. There is a risk that new tax legislation and U.S. Treasury regulations or Internal Revenue Service positions could limit the extent to which income or gains from those instruments are treated as qualifying income. Therefore, the Fund's investments in CDS could be limited by the Fund's intention to qualify as a regulated investment company and could bear adversely on the Fund's ability to so qualify. If in any year the Fund were to fail to qualify as a regulated investment company, it would be taxed in the same manner as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce the Fund's net assets and the amount of income available for distribution.

- **Valuation Risk** – In certain circumstances, portfolio assets may be valued using techniques other than market quotations. The value established for a portfolio asset may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio assets that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio asset for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio asset is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.

### Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After a full year, performance information will be shown on an annual basis.

### Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since August 2014.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which comprises 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most exchange-traded funds.

## Investment Objective

ProShares CDS Short North American HY Credit ETF (the “Fund”) seeks to provide inverse exposure to the credit of North American high yield debt issuers.

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.65%
Other Expenses	0.80%

### Total Annual Operating Expenses Before Fee

<b>Waivers and Expense Reimbursements</b>	<b>1.45%</b>
Fee Waiver/Reimbursement*	-0.95%

### Total Annual Operating Expenses After Fee

<b>Waivers and Expense Reimbursements</b>	<b>0.50%</b>
---	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.50% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$51	\$365	\$702	\$1,653

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s

performance. The Fund’s portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If these transactions were included, the Fund’s portfolio turnover rate would be significantly higher. During the period from August 5, 2014 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 0% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund seeks to achieve its investment objective primarily through investing in a portfolio of credit derivatives whose underlying reference entities are North American high yield (i.e., below investment grade or “junk bond”) debt issuers. Under normal circumstances, the Fund will invest at least 80% of its net assets in centrally cleared, index-based credit default swaps (“CDS”) that, in combination, should have economic characteristics that correlate to the inverse of the North American high yield credit market. For these purposes, investments in centrally cleared, index-based CDS include not only the amounts associated with direct investments in the CDS but also cash and cash equivalents that are segregated on the Fund’s books and records or are being used as collateral or otherwise available to cover the investment exposure associated with the CDS.

ProShare Advisors will actively manage the Fund, selecting credit derivatives based on the following primary considerations:

- **Diversification** – maintaining broadly diversified exposure to the credit of North American high yield debt issuers;
- **Liquidity** – favoring credit derivatives with greater relative liquidity; and
- **Sensitivity to Changes in Credit Quality** – generally favoring credit derivatives having greater sensitivity to changes in credit quality.

ProShare Advisors may, at times, also consider other factors such as the relative value of one credit derivative versus another.

The Fund seeks to increase in value as the overall North American high yield credit market declines (i.e., the likelihood of payment by North American high yield debt issuers decreases), while also seeking to limit the impact of a change in the credit quality of any single high yield debt issuer.

Credit markets are commonly considered to be declining when credit spreads (i.e., the level of additional yield that is paid on corporate bonds as compared to Treasury securities) are generally increasing.

**The Fund is different from most exchange-traded funds in that it seeks inverse, or “short”, exposure and invests in credit derivatives. The Fund may not be suitable for all investors and should be used only by knowledgeable investors. Shareholders should actively manage and monitor their investments, as frequently as daily. See “Principal Risks” for additional information.**

The derivatives and securities that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in very short-term money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund primarily invests in derivatives to obtain inverse exposure to North American high yield credit. These derivatives principally include:

- **Credit Default Swaps (CDS)** – The Fund intends to primarily invest in centrally cleared, index-based CDS. CDS provide exposure to the credit of one or more debt issuers referred to as “reference entities.” These instruments are designed to reflect changes in credit quality, including events of default. CDS are most commonly discussed in terms of buying or selling credit protection with respect to a reference entity. Buying credit protection is equivalent to being “short” credit. Because the Fund seeks to provide short exposure to credit, it will generally be a net buyer of credit protection with respect to North American high yield debt issuers. Index-based CDS provide credit exposure, through a single trade, to a basket of reference entities. A variety of high yield, index-based CDS with different characteristics are currently available in the marketplace with new issuances occurring periodically. Issuances typically vary in terms of underlying reference entities and maturity and, thus, can have significant differences in performance over time.

For North American high yield, index-based CDS, there are typically new issuances every six months of 5.25 year maturity swap on a 100-name basket, which names vary from issue to issue. Older issues have remaining maturities of up to 4.75 years.

- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles. Under normal circumstances, the Fund’s investments in such instruments will, in aggregate, maintain a weighted average maturity of three months or less. Such money market instruments include:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the United States.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

The Fund seeks to remain fully invested (i.e., will not take defensive positions). As such, the Fund should be expected to decrease in value when overall North American high yield credit markets improve. Credit markets are commonly considered to be improving when credit spreads (i.e., the level of additional yield that is paid on corporate bonds as compared to Treasury securities) are generally decreasing.

The Fund will periodically adjust its holdings in order to maintain inverse exposure approximately equivalent to its assets. As the relevant credit market declines (i.e., the likelihood of payment by

North American high yield debt issuers decreases), net assets of the Fund will generally increase resulting in inverse exposure that is less than the value of the Fund’s assets. Conversely, when the credit market improves, net assets of the Fund will generally decrease resulting in inverse exposure that is more than the value of the Fund’s assets, and the Fund’s inverse exposure will be periodically adjusted to restore approximately equivalent inverse exposure.

**As with any shorting strategy that is periodically rebalanced, the return of the Fund over time will commonly differ from the inverse of the return of a similar long position. The Fund will lose money over time when the relevant credit market remains stable, and it is possible that the Fund will lose money over time even if the credit market declines.**

The Fund will seek to obtain only non-leveraged short credit exposure (i.e., exposure equivalent to Fund assets).

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in securities. These risks include counterparty risk and liquidity risk (each as discussed below). Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- **Credit Default Swap (CDS) Risk** – The Fund will normally be a net buyer of credit protection on North American high yield debt issuers through index-based CDS. Upon the occurrence of a credit event, the counterparty to the Fund will have an obligation to pay the full notional value of a defaulted reference entity less recovery value. Recovery values for CDS are generally determined via an auction process to determine the final price for a given reference entity. Although the Fund intends, as practicable, to obtain initial exposure primarily through centrally cleared CDS, an active market may not exist for any of the CDS in which the Fund invests or in the reference entities subject to the CDS. As a result, the Fund’s ability to maximize returns or minimize losses on such CDS may be impaired. Other risks of CDS include difficulty in valuation due to the lack of pricing transparency and the risk that changes in the value of the CDS do not reflect changes in the credit quality of the underlying reference entities or may otherwise perform differently than expected given market conditions.
- **High Yield Credit Risk** – Exposure to high yield (or “junk”) credit may involve greater levels of credit, liquidity and valuation risk than for higher rated instruments. High yield credit may be more sensitive to economic changes, political changes, or adverse developments specific to a company than other types of credit. High yield credit is also subject to greater risk of loss,

greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market. High yield credit is considered predominantly speculative with respect to the issuer's continuing ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than other types of credit. An economic downturn or period of rising interest rates could adversely affect the market for high yield credit and reduce market liquidity (liquidity risk). Less active markets may diminish the Fund's ability to obtain accurate market quotations when valuing high yield credit and thereby give rise to valuation risk. While the realization of certain of the risks of high yield credit may benefit the Fund because the Fund seeks investment results that correspond to the inverse of the North American high yield credit market, such occurrences may introduce more volatility to the Fund. In addition, although the Fund will have inverse exposure to the North American high yield credit market, there is no guarantee that the inverse exposure will completely eliminate credit risk.

- **Compounding Risk** – In the course of managing the Fund's investments, ProShare Advisors will need to periodically adjust the Fund's holdings in order to maintain investment exposure approximately equivalent to the Fund's assets. This process entails obtaining additional inverse exposure as the Fund experiences gains, and reducing inverse exposure as the Fund experiences losses. The higher the volatility is in the credit markets, the more such rebalancing can adversely affect the Fund's performance.
- **Active Management Risk** – The performance of actively managed funds reflect, in part, the ability of ProShare Advisors to select investments and make investment decisions that are suited to achieving the Fund's investment objective. ProShare Advisors' judgments about the Fund's investments may prove to be incorrect. If the investments selected and strategies employed by the Fund fail to produce the intended results, the Fund could underperform other funds with a similar investment objective and/or strategies.
- **Counterparty Risk** – While the instruments the Fund will use will be centrally cleared, the Fund will still be subject to credit risk with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of your investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Inverse Correlation Risk** – Shareholders should lose money when the North American high yield credit market improves—a result

that is the opposite from the results of investing in long North American high yield credit market funds.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the North American high yield credit market.
- **Market Risk** – The Fund is subject to market risks that will affect the value of its shares, including adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Volatility in the market and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse of the North American high yield credit market, the Fund's performance will generally decrease when market conditions cause the North American high yield credit market to rise.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on BATS Exchange and can be bought and sold in the secondary market at market prices. The market prices of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than the BATS Exchange. Because the Fund generally values such securities as of the bond market closing time, the daily NAV performance will vary from the market performance of the Fund as of the BATS Exchange close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on the BATS Exchange. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Because of the nature of the high yield credit market, shares may typically trade at a larger premium or discount to the value of the Fund's holdings than shares of many other ETFs. The Fund's investment results are measured based upon the daily net asset value ("NAV") of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability

to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Periodic rebalancing of Fund holdings, which is necessary to maintain inverse exposure approximately equivalent to the Fund's assets, will cause a higher level of portfolio transactions than compared to most ETFs. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse exposure through financial instruments, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of the credits underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as credit default swaps (CDS) or futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the credits underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective (e.g., due to a lack of available investments or counterparties). During such periods, the Fund's ability to issue additional Creation Units, as set forth below, may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund. Inverse exposure must be actively managed in order to keep the Fund fully invested—see "Compounding Risk" for an explanation of how this impacts performance.
- **Tax Risk** — In order to qualify for treatment as a regulated investment company for federal income tax purposes, the Fund must derive at least 90% of its gross income for each taxable year from "qualifying income," meet certain asset diversification tests at the end of each taxable quarter, and distribute annually to its shareholders at least 90% of its ordinary income and realized net short-term capital gains. The tax treatment of certain swaps, such as CDS, is unclear in several respects. There is a risk that new tax legislation and U.S. Treasury regulations or Internal Revenue Service positions could limit the extent to

which income or gains from those instruments are treated as qualifying income. Therefore, the Fund's investments in CDS could be limited by the Fund's intention to qualify as a regulated investment company and could bear adversely on the Fund's ability to so qualify. If in any year the Fund were to fail to qualify as a regulated investment company, it would be taxed in the same manner as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce the Fund's net assets and the amount of income available for distribution.

- **Valuation Risk** — In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that the Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the Fund's Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After a full year, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since August 2014.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which comprises 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most exchange-traded funds.

## Important Information About the Fund

ProShares Short S&P500 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the S&P 500® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.15%
<b>Total Annual Fund Operating Expenses*</b>	<b>0.90%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your

investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$92	\$287	\$498	\$1,108

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index is a measure of large-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 500 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$3.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$39.3 billion. The Index is published under the Bloomberg ticker symbol “SPX.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return

(or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer**

**than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

Estimated Fund Returns						
Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund’s actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in “Principal Risks—Correlation Risk” below.

The Index’s annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.17%. The Index’s highest June to June volatility rate during the five-year period was 23.54% (June 29, 2012). The Index’s annualized total return performance for the five-year period ended June 30, 2015 was 17.33%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests.

The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2008): 14.48%

Worst Quarter (ended 6/30/2009): -15.40%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -2.14%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-13.67%	-16.15%	-10.57%	6/19/2006
After Taxes on Distributions	-13.67%	-16.15%	-11.33%	—
After Taxes on Distributions and Sale of Shares	-7.74%	-11.14%	-6.80%	—
S&P 500 <sup>#</sup>	13.69%	15.45%	8.41%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short QQQ (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the NASDAQ-100 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.31%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.06%</b>
Fee Waiver/Reimbursement*	-0.11%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$326	\$574	\$1,284

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index, a modified market capitalization-weighted index, includes 100 of the largest non-financial domestic and international issues listed on The NASDAQ Stock Market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$5.6 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$55.3 billion. The Index is published under the Bloomberg ticker symbol “NDX.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period

ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired

exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Inverse (-1x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.67%. The Index's highest June to June volatility rate during the five-year period was 24.08% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 21.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's

holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional

Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology industry to the same extent as the Index is so concentrated. Securities of information technology companies may be subject to greater volatility than stocks of companies in other market sectors. Like other technology companies, information technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Information technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the information technology industries as a whole. The information technology industry may also be affected by risks that affect the telecommunications industry, including a telecommunications market characterized by increasing competition and regulation by the Federal Communications Commission and various state regulatory authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 12/31/2008): 17.51%

Worst Quarter (ended 3/31/2012): -18.01%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -5.44%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-18.42%	-19.38%	-15.34%	6/19/2006
After Taxes on Distributions	-18.42%	-19.38%	-15.77%	—
After Taxes on Distributions and Sale of Shares	-10.43%	-13.03%	-9.33%	—
NASDAQ-100 Index <sup>#</sup>	19.40%	19.22%	13.51%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax

returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Dow30 (the “Fund”) seeks investment results for **a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Dow Jones Industrial Average<sup>SM</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.25%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.00%</b>
Fee Waiver/Reimbursement*	-0.05%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$313	\$548	\$1,220

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index is a price-weighted index and includes 30 large-cap, “blue-chip” U.S. stocks, excluding utility and transportation companies. Components are selected through a discretionary process with no pre-determined criteria except that components should be established U.S. companies that are leaders in their industries, have an excellent reputation, demonstrate sustained growth, are of interest to a large number of investors and accurately represent the sectors covered by the average. The Index is not limited to traditionally defined industrial stocks; instead, the Index serves as a measure of the entire U.S. market, covering such diverse industries as financial services, technology, retail, entertainment and consumer goods. Composition changes are rare, and generally occur only after corporate acquisitions or other dramatic shifts in a component’s core business. When such an event necessitates the replacement of one component, the entire Index is reviewed. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.8 billion and \$722.6 billion. The average capitalization of the companies

comprising the Index was approximately \$180.7 billion. The Index is published under the Bloomberg ticker symbol "INDU."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds ("ETFs")), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1X) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the

assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from the inverse (-1X) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due

to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.97%. The Index's highest June to June volatility rate during the five-year period was 21.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 15.40%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high

degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to

accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's

holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse

exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2008): 10.99%

Worst Quarter (ended 9/30/2009): -14.37%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -1.05%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-10.75%	-14.95%	-10.25%	6/19/2006
After Taxes on Distributions	-10.75%	-14.95%	-10.88%	—
After Taxes on Distributions and Sale of Shares	-6.08%	-10.41%	-6.73%	—
Dow Jones Industrial Average <sup>SM</sup>	10.04%	14.22%	8.70%	—

\* Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short MidCap400 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the S&P MidCap 400® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.33%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.08%</b>
Fee Waiver/Reimbursement*	-0.13%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$331	\$583	\$1,305

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index is a measure of mid-size company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 400 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$11.7 billion. The average capitalization of the companies comprising the Index was approximately \$4.2 billion. The Index is published under the Bloomberg ticker symbol “MID.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s

portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to

immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.10%. The Index's highest June to June volatility rate during the five-year period was 29.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.81%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of

inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will

fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse

exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 19.40%

Worst Quarter (ended 6/30/2009): -18.42%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -5.12%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-11.23%	-18.03%	-13.29%	6/19/2006
After Taxes on Distributions	-11.23%	-18.03%	-14.06%	—
After Taxes on Distributions and Sale of Shares	-6.36%	-12.26%	-8.09%	—
S&P MidCap 400®#	9.77%	16.53%	10.02%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for

all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Russell2000 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Russell 2000® Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.27%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.02%</b>
Fee Waiver/Reimbursement*	-0.07%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$318	\$556	\$1,241

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index is a measure of small-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index containing approximately 2000 of the smallest companies in the Russell 3000® Index or approximately 8% of the total market capitalization of the Russell 3000® Index, which in turn represents approximately 98% of the investable U.S. equity market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$102.5 million and \$4.7 billion. The average capitalization of the companies comprising the Index was approximately \$1.1 billion. The Index is published under the Bloomberg ticker symbol “RTY.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The

Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the

Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.16%. The Index's highest June to June volatility rate during the five-year period was 33.27% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.07%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments

correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors.

ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an

aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 21.16%

Worst Quarter (ended 6/30/2009): -20.46%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -6.11%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-8.41%	-18.97%	-13.82%	1/23/2007
After Taxes on Distributions	-8.41%	-18.97%	-14.95%	—
After Taxes on Distributions and Sale of Shares	-4.76%	-12.80%	-8.16%	—
Russell 2000® Index#	4.89%	15.54%	7.00%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short SmallCap600 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the S&P Small-Cap 600® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.88%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.63%</b>
Fee Waiver/Reimbursement*	-0.68%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$448	\$822	\$1,876

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index is a measure of small-cap company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 600 U.S. operating companies selected through a process that factors in criteria such as liquidity, price, market capitalization, financial viability and public float. As of June 30, 2015, the Index included companies with capitalizations between approximately \$72.3 million and \$16.8 billion. The average capitalization of the companies comprising the Index was approximately \$1.3 billion. The Index is published under the Bloomberg ticker symbol “SML.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion

of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 20.30%. The Index's highest June to June volatility rate during the five-year period was 32.06% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 18.43%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to

rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger

companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 18.74%

Worst Quarter (ended 6/30/2009): -20.73%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -5.35%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-8.75%	-19.55%	-13.98%	1/23/2007
After Taxes on Distributions	-8.75%	-19.55%	-15.56%	—
After Taxes on Distributions and Sale of Shares	-4.95%	-13.13%	-7.95%	—
S&P SmallCap 600®#	5.76%	17.26%	8.51%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the

historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort S&P500 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the S&P 500® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.16%
<b>Total Annual Fund Operating Expenses*</b>	<b>0.91%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the

end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$93	\$290	\$504	\$1,120

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a measure of large-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 500 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$3.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$39.3 billion. The Index is published under the Bloomberg ticker symbol “SPX.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard

“swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.17%. The Index's highest June to June volatility rate during the five-year period was 23.54% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.33%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or

financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment

objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 23.73%

Worst Quarter (ended 6/30/2009): -29.51%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -4.52%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-25.74%	-30.93%	-23.73%	7/11/2006
After Taxes on Distributions	-25.74%	-30.93%	-24.48%	—
After Taxes on Distributions and Sale of Shares	-14.57%	-18.58%	-11.61%	—
S&P 500®#	13.69%	15.45%	8.12%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates

and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort QQQ (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the NASDAQ-100 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.29%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.04%</b>
Fee Waiver/Reimbursement*	-0.09%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$322	\$565	\$1,263

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index, a modified market capitalization-weighted index, includes 100 of the largest non-financial domestic and international issues listed on The NASDAQ Stock Market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$5.6 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$55.3 billion. The Index is published under the Bloomberg ticker symbol “NDX.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The

Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with

respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

Estimated Fund Returns						
Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.67%. The Index's highest June to June volatility rate during the five-year period was 24.08% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 21.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the**

**Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities

would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more

costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- **Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology industry to the same extent as the Index is so concentrated. Securities of information technology companies may be subject to greater volatility than stocks of companies in other market sectors. Like other technology companies, information technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Information technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the information technology industries as a whole. The information technology industry may also be affected by risks that affect the telecommunications industry, including a telecommunications market characterized by increasing competition and regulation by the Federal Communications Commission and various state regulatory authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 3/31/2008): 31.54%

Worst Quarter (ended 6/30/2009): -33.52%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -11.00%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-34.14%	-36.46%	-32.71%	7/11/2006
After Taxes on Distributions	-34.14%	-36.46%	-33.27%	—
After Taxes on Distributions and Sale of Shares	-19.32%	-20.53%	-13.55%	—
NASDAQ-100 Index <sup>#</sup>	19.40%	19.22%	13.75%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Dow30 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones Industrial Average<sup>SM</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.26%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.01%</b>
Fee Waiver/Reimbursement*	-0.06%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$316	\$552	\$1,231

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a price-weighted index and includes 30 large-cap, “blue-chip” U.S. stocks, excluding utility and transportation companies. Components are selected through a discretionary process with no predetermined criteria except that components should be established U.S. companies that are leaders in their industries, have an excellent reputation, demonstrate sustained growth, are of interest to a large number of investors and accurately represent the sectors covered by the average. The Index is not limited to traditionally defined industrial stocks; instead, the Index serves as a measure of the entire U.S. market, covering such diverse industries as financial services, technology, retail, entertainment and consumer goods. Composition changes are rare, and generally occur only after corporate acquisitions or other dramatic shifts in a component’s core business. When such an event necessitates the replacement of one component, the entire Index is reviewed. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.8 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$180.7 billion. The Index is published under the Bloomberg ticker symbol “INDU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in

combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset,

the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse

leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.97%. The Index's highest June to June volatility rate during the five-year period was 21.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 15.40%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to

financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of

events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be

exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 19.02%

Worst Quarter (ended 9/30/2009): -27.04%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -2.50%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-20.59%	-28.66%	-22.83%	7/11/2006
After Taxes on Distributions	-20.59%	-28.66%	-23.90%	—
After Taxes on Distributions and Sale of Shares	-11.65%	-17.65%	-11.16%	—
Dow Jones Industrial Average <sup>SM</sup> #	10.04%	14.22%	8.53%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MidCap400 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the S&P MidCap 400® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.08%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.83%</b>
Fee Waiver/Reimbursement*	-0.88%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$490	\$908	\$2,076

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a measure of mid-size company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 400 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$11.7 billion. The average capitalization of the companies comprising the Index was approximately \$4.2 billion. The Index is published under the Bloomberg ticker symbol “MID.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The

Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the

Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times the inverse (-2x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.10%. The Index's highest June to June volatility rate during the five-year period was 29.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.81%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment

objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 37.18%

Worst Quarter (ended 6/30/2009): -35.32%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -10.25%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-21.70%	-34.70%	-29.06%	7/11/2006
After Taxes on Distributions	-21.70%	-34.70%	-30.07%	—
After Taxes on Distributions and Sale of Shares	-12.28%	-19.96%	-11.99%	—
S&P MidCap 400®#	9.77%	16.53%	9.63%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Russell2000 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Russell 2000® Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.30%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.05%</b>
Fee Waiver/Reimbursement*	-0.10%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$324	\$570	\$1,274

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a measure of small-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index containing approximately 2000 of the smallest companies in the Russell 3000® Index or approximately 8% of the total market capitalization of the Russell 3000® Index, which in turn represents approximately 98% of the investable U.S. equity market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$102.5 million and \$4.7 billion. The average capitalization of the companies comprising the Index was approximately \$1.1 billion. The Index is published under the Bloomberg ticker symbol “RTY.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used

swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Two times the inverse (-2x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.16%. The Index's highest June to June volatility rate during the five-year period was 33.27% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.07%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial

instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These

situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be

thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 40.00%

Worst Quarter (ended 6/30/2009): -38.98%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -12.26%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-17.55%	-37.10%	-31.58%	1/23/2007
After Taxes on Distributions	-17.55%	-37.10%	-32.48%	—
After Taxes on Distributions and Sale of Shares	-9.93%	-20.73%	-12.95%	—
Russell 2000® Index <sup>#</sup>	4.89%	15.54%	7.00%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort SmallCap600 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the S&P SmallCap 600® (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.69%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.44%</b>
Fee Waiver/Reimbursement*	-1.49%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or

reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$247	\$450	\$670	\$1,301

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a measure of small-cap company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 600 U.S. operating companies selected through a process that factors in criteria such as liquidity, price, market capitalization, financial viability and public float. As of June 30, 2015, the Index included companies with capitalizations between approximately \$72.3 million and \$16.8 billion. The average capitalization of the companies comprising the Index was approximately \$1.3 billion. The Index is published under the Bloomberg ticker symbol “SML.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result,

the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired

exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 20.30%. The Index's highest June to June volatility rate during the five-year period was 32.06% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 18.43%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or

financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary

market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap

companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 34.90%

Worst Quarter (ended 6/30/2009): -39.42%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -10.96%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-17.95%	-37.78%	-31.27%	1/23/2007
After Taxes on Distributions	-17.95%	-37.78%	-32.29%	—
After Taxes on Distributions and Sale of Shares	-10.16%	-20.93%	-12.62%	—
S&P SmallCap 600®#	5.76%	17.26%	8.51%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short S&P500 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the S&P 500® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.18%

<b>Total Annual Fund Operating Expenses*</b>	<b>0.93%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$95	\$296	\$515	\$1,143

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index is a measure of large-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 500 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$3.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$39.3 billion. The Index is published under the Bloomberg ticker symbol “SPX.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period

ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from

achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance	Three times the Inverse (-3x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.17%. The Index's highest June to June volatility rate during the five-year period was 23.54% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.33%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or

financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund.

Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 32.30%

Worst Quarter (ended 12/31/2011): -36.01%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -7.58%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-36.98%	-44.56%	-49.18%	6/23/2009
After Taxes on Distributions	-36.98%	-44.56%	-49.18%	—
After Taxes on Distributions and Sale of Shares	-20.93%	-22.59%	-21.86%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for

all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large

blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short QQQ (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the NASDAQ-100 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.30%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.05%</b>
Fee Waiver/Reimbursement*	-0.10%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$324	\$570	\$1,274

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index, a modified market capitalization-weighted index, includes 100 of the largest non-financial domestic and international issues listed on The NASDAQ Stock Market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$5.6 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$55.3 billion. The Index is published under the Bloomberg ticker symbol “NDX.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a

swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance	Three times the Inverse (-3x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.67%. The Index's highest June to June volatility rate during the five-year period was 24.08% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 21.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or

financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on The NASDAQ Stock Market and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s

investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology industry to the same extent as the Index is so concentrated. Securities of

information technology companies may be subject to greater volatility than stocks of companies in other market sectors. Like other technology companies, information technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Information technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the information technology industries as a whole. The information technology industry may also be affected by risks that affect the telecommunications industry, including a telecommunications market characterized by increasing competition and regulation by the Federal Communications Commission and various state regulatory authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2012): 10.54%

Worst Quarter (ended 3/31/12): -45.21%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -17.02%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-47.89%	-53.61%	2/09/2010
After Taxes on Distributions	-47.89%	-53.61%	—
After Taxes on Distributions and Sale of Shares	-27.11%	-24.33%	—
NASDAQ-100 Index®#	19.40%	21.13%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short Dow30 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Dow Jones Industrial Average<sup>SM</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.29%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.04%</b>
Fee Waiver/Reimbursement*	-0.09%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$322	\$565	\$1,263

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index is a price-weighted index and includes 30 large-cap, “blue-chip” U.S. stocks, excluding utility and transportation companies. Components are selected through a discretionary process with no predetermined criteria except that components should be established U.S. companies that are leaders in their industries, have an excellent reputation, demonstrate sustained growth, are of interest to a large number of investors and accurately represent the sectors covered by the average. The Index is not limited to traditionally defined industrial stocks; instead, the Index serves as a measure of the entire U.S. market, covering such diverse industries as financial services, technology, retail, entertainment and consumer goods. Composition changes are rare, and generally occur only after corporate acquisitions or other dramatic shifts in a component’s core business. When such an event necessitates the replacement of one component, the entire

Index is reviewed. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.8 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$180.7 billion. The Index is published under the Bloomberg ticker symbol "INDU."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds ("ETFs")), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on

ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess

of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index

performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Three times the Inverse (-3x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.97%. The Index's highest June to June volatility rate during the five-year period was 21.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 15.40%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial

instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 25.89%

Worst Quarter (ended 12/31/2011): -36.35%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -4.71%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-30.16%	-42.94%	2/09/2010
After Taxes on Distributions	-30.16%	-42.94%	—
After Taxes on Distributions and Sale of Shares	-17.07%	-22.53%	—
Dow Jones Industrial Average <sup>SM#</sup>	10.04%	15.34%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily

inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short MidCap400 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the S&P MidCap 400® (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.44%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.19%</b>
Fee Waiver/Reimbursement*	-1.24%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$566	\$1,061	\$2,426

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index is a measure of mid-size company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 400 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 billion and \$11.7 billion. The average capitalization of the companies comprising the Index was approximately \$4.2 billion. The Index is published under the Bloomberg ticker symbol “MID.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with

respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Three times the Inverse (-3x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.10%. The Index's highest June to June volatility rate during the five-year period was 29.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.81%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the**

**Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of

events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the

Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 51.25%

Worst Quarter (ended 12/31/2011): -41.86%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -15.82%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-32.54%	-51.53%	2/9/2010
After Taxes on Distributions	-32.54%	-51.53%	—
After Taxes on Distributions and Sale of Shares	-18.42%	-24.07%	—
S&P MidCap 400 <sup>®</sup> #	9.77%	17.76%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors

who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short Russell2000 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Russell 2000® Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.37%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.12%</b>
Fee Waiver/Reimbursement*	-0.17%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$339	\$600	\$1,348

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index is a measure of small-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index containing approximately 2000 of the smallest companies in the Russell 3000® Index or approximately 8% of the total market capitalization of the Russell 3000® Index, which in turn represents approximately 98% of the investable U.S. equity market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$102.5 million and \$4.7 billion. The average capitalization of the companies comprising the Index was approximately \$1.1 billion. The Index is published under the Bloomberg ticker symbol “RTY.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the

Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the

Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Three times the Inverse (-3x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.16%. The Index's highest June to June volatility rate during the five-year period was 33.27% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.07%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the**

**Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of

events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the

Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 53.72%

Worst Quarter (ended 12/31/2011): -49.92%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -18.96%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-27.96%	-55.39%	2/9/2010
After Taxes on Distributions	-27.96%	-55.39%	—
After Taxes on Distributions and Sale of Shares	-15.83%	-24.52%	—
Russell 2000 <sup>#</sup>	4.89%	17.07%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to invest-

ors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Basic Materials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Dow Jones U.S. Basic Materials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	7.33%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>8.08%</b>
Fee Waiver/Reimbursement*	-7.13%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$1,727	\$3,258	\$6,692

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index measures the performance of the basic materials sector of the U.S. equity market. Component companies are involved in the production of aluminum, steel, non-ferrous metals, commodity chemicals, specialty chemicals, forest products, paper products, as well as the mining of precious metals and coal. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$59.0 billion. The average capitalization of the companies comprising the Index was approximately \$11.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSBM.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group. Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion

of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.50%. The Index's highest June to June volatility rate during the five-year period was 33.40% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 11.05%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's

holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income,

dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 32.22%

Worst Quarter (ended 12/31/2011): -17.01%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.06%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-6.26%	-13.08%	3/16/2010
After Taxes on Distributions	-6.26%	-13.08%	—
After Taxes on Distributions and Sale of Shares	-3.54%	-9.27%	—
Dow Jones U.S. Basic Materials <sup>SM</sup> Index <sup>#</sup>	3.39%	8.00%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or

delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Financials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Dow Jones U.S. Financials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.60%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.35%</b>
Fee Waiver/Reimbursement*	-0.40%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$388	\$701	\$1,589

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index measures the performance of the financial services sector of the U.S. equity market. Component companies include: among others, regional banks; major U.S. domiciled international banks; full line, life, and property and casualty insurance companies; companies that invest, directly or indirectly in real estate; diversified financial companies such as Fannie Mae, credit card issuers, check cashing companies, mortgage lenders and investment advisors; securities brokers and dealers including investment banks, merchant banks and online brokers; and publicly traded stock exchanges. As of June 30, 2015, the Index included companies with capitalizations between approximately \$620.0 million and \$336 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSFN.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap

agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Inverse (-1x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 19.85%. The Index's highest June to June volatility rate during the five-year period was 32.78% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.88%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to

acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include,

under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 20.11%

Worst Quarter (ended 6/30/2009): -30.71%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -1.71%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-14.79%	-16.94%	-18.47%	6/10/2008
After Taxes on Distributions	-14.79%	-16.94%	-18.65%	—
After Taxes on Distributions and Sale of Shares	-8.37%	-11.62%	-11.68%	—
Dow Jones U.S. Financials <sup>SM</sup> Index <sup>#</sup>	14.59%	13.89%	4.69%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Oil & Gas (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Dow Jones U.S. Oil & Gas<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	3.57%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>4.32%</b>
Fee Waiver/Reimbursement*	-3.37%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$1,002	\$1,920	\$4,268

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index measures the performance of the oil and gas sector of the U.S. equity market. Component companies include, among others, exploration and production, integrated oil and gas, oil equipment and services, pipelines, renewable energy equipment companies and alternative fuel producers. As of June 30, 2015, the Index included companies with capitalizations between approximately \$248.4 million and \$347.9 billion. The average capitalization of the companies comprising the Index was approximately \$18.0 billion. The Index is published under the Bloomberg ticker symbol “DJUSEN.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the energy industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Inverse (-1x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 20.88%. The Index's highest June to June volatility rate during the five-year period was 30.24% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 10.43%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Energy Industry Risk** – The Fund is subject to risks faced by companies in the energy sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where energy companies are located or do business; and risk for environmental damage claims. The energy industry has recently experienced significant volatility due to dramatic changes in the prices of energy commodities, and it is possible that such volatility will continue in the future.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the

Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss,

have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 20.86%

Worst Quarter (ended 12/31/2011): -18.23%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 1.76%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	5.50%	-12.73%	-10.13%	6/10/2008
After Taxes on Distributions	5.50%	-12.73%	-11.38%	—
After Taxes on Distributions and Sale of Shares	3.11%	-9.01%	-6.64%	—
Dow Jones U.S. Oil & Gas <sup>SM</sup> Index <sup>#</sup>	-9.27%	8.35%	0.56%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Real Estate (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Dow Jones U.S. Real Estate<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.48%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.23%</b>
Fee Waiver/Reimbursement*	-0.28%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$363	\$649	\$1,464

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index measures the performance of the real estate sector of the U.S. equity market. Component companies include, among others, real estate holding and development and real estate services companies and real estate investment trusts (“REITs”). REITs are passive investment vehicles that invest primarily in income producing real estate or real estate related loans or interests. As of June 30, 2015, the Index included companies with capitalizations between approximately \$990.2 million and \$53.9 billion. The average capitalization of the companies comprising the Index was approximately \$7.2 billion. The Index is published under the Bloomberg ticker symbol “DJUSRE.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.37%. The Index's highest June to June volatility rate during the five-year period was 28.40% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 13.41%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
  - **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
  - **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
  - **Real Estate Investment Trusts Industry Risk** – The Fund is subject to risks faced by companies in the real estate investment trusts industry to the same extent as the Index is so concentrated. Like the broader real estate industry, REITs may be affected by adverse changes in national, state or local real estate conditions (such as over-supply of or reduced demand for space and changes in market rental rates); obsolescence of properties; changes in the availability, cost and terms of mortgage funds; and the impact of environmental laws. Further, REITs are dependent upon specialized management skills, and their investments may be concentrated in relatively few properties, or in a small geographic area or a single property type. REITs are also subject to heavy cash flow dependency and, as a result, are particularly reliant on the proper functioning of capital markets. REITs may also be affected by the failure to comply with the federal tax requirements affecting REITs which could subject a REIT to federal income taxation; and the risk that the federal tax requirement that a REIT distribute substantially all of its net income to its shareholders could result in a REIT having insufficient capital for future expenditures.
  - **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
  - **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
- Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.
- ### Investment Results
- The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 12.89%

Worst Quarter (ended 12/31/2011): -14.87%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 3.84%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-22.93%	-16.99%	3/16/2010
After Taxes on Distributions	-22.93%	-16.99%	—
After Taxes on Distributions and Sale of Shares	-12.98%	-11.72%	—
Dow Jones U.S. Real Estate <sup>SM</sup> Index <sup>#</sup>	27.24%	14.30%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors

who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short S&P Regional Banking (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the S&P Regional Banks Select Industry Index<sup>SM</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	6.58%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>7.33%</b>
Fee Waiver/Reimbursement*	-6.38%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$1,587	\$3,008	\$6,282

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The S&P Regional Banks Select Industry Index is an equal-weighted index that seeks to provide diverse regional banking exposure. The Index includes stocks of 50 publicly traded companies that do business as regional banks or thrifts. Component companies include, among others, leading regional banks or thrifts listed on a U.S. exchange. As of June 30, 2015, the Index included companies with capitalizations between approximately \$349.9 million and \$49.5 billion. The average capitalization of the companies comprising the Index was approximately \$4.4 billion. The Index is published under the Bloomberg ticker symbol “SPSIRBK.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Inverse (-1x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 24.13%. The Index's highest June to June volatility rate during the five-year period was 38.54% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.86%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Regional Banking Industry Risk** – The Fund is subject to risks faced by companies in the banks economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects on profitability due to increases in interest rates or loan losses (which usually increase in economic downturns, which could lead to insolvency or other negative consequences); severe price competition; economic conditions; credit rating downgrades; and increased inter-industry consolidation and competition. This sector has experienced significant losses in the past, and the impact of more stringent capital requirements and of recent or future regulation on any individual bank or on the sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in

which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a

single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides

some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 21.86%

Worst Quarter (ended 12/31/2011): -26.50%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -11.37%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-6.70%	-15.72%	4/20/2010
After Taxes on Distributions	-6.70%	-15.72%	—
After Taxes on Distributions and Sale of Shares	-3.79%	-10.97%	—
KBW Nasdaq Regional Banking Index*	2.42%	9.51%	—
S&P Regional Banks Select Industry Index <sup>SM</sup> #	2.35%	9.06%	—

\*On April 16, 2015, the Fund's underlying index changed from the KBW Regional Banking Index to the S&P Regional Banks Select Industry Index. This change was made in order to match the Fund's underlying index to its Investment Objective. As of June 2015, the name of the KBW Regional Banking Index was changed to the KBW Nasdaq Regional Banking Index.

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Basic Materials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Basic Materials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.86%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.61%</b>
Fee Waiver/Reimbursement*	-0.66%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$443	\$814	\$1,855

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the basic materials sector of the U.S. equity market. Component companies are involved in the production of aluminum, steel, non-ferrous metals, commodity chemicals, specialty chemicals, forest products, paper products, as well as the mining of precious metals and coal. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$59.0 billion. The average capitalization of the companies comprising the Index was approximately \$11.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSBM.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired

exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse

leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.50%. The Index's highest June to June volatility rate during the five-year period was 33.40% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 11.05%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to

financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of

events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through

alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2008): 82.09%

Worst Quarter (ended 6/30/2009): -44.08%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.70%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-13.31%	-29.47%	-34.37%	1/30/2007
After Taxes on Distributions	-13.31%	-29.47%	-35.66%	—
After Taxes on Distributions and Sale of Shares	-7.53%	-17.99%	-13.20%	—
Dow Jones U.S. Basic Materials <sup>SM</sup> Index <sup>#</sup>	3.39%	9.08%	6.19%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception

returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Nasdaq Biotechnology (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the NASDAQ Biotechnology Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.40%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.15%</b>
Fee Waiver/Reimbursement*	-0.20%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$346	\$614	\$1,380

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a modified capitalization weighted index that includes securities of NASDAQ listed companies that are classified as either biotechnology or pharmaceutical according to the Industry Classification Benchmark (“ICB”) which also meet other eligibility criteria determined by NASDAQ, including minimum market capitalization and liquidity requirements. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.1 million and \$172.1 billion. The average capitalization of the companies comprising the Index was approximately \$7.1 billion. The Index is published under the Bloomberg ticker symbol “NBI.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result,

the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the health care industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to

immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 22.33%. The Index's highest June to June volatility rate during the five-year period was 27.11% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 37.34%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund,

potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Health Care Industry Risk** – The Fund is subject to risks faced by companies in the healthcare economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; expenses and losses from extensive litigation based on product liability and similar claims; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting; the long and costly process for obtaining new product approval by the Food and Drug Administration; the difficulty healthcare providers may have obtaining staff to deliver service; susceptibility to product obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel.
- **Biotechnology Industry Risk** – The Fund is subject to risks faced by companies in the biotechnology economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patents and intellectual property rights, with profitability affected by the loss or impairment of such rights;

risks of new technologies and competitive pressures; large expenditures on research and development of products or services that may not prove commercially successful or may become obsolete quickly; regulations and restrictions imposed by the Food and Drug Administration, the Environmental Protection Agency, state and local governments, and foreign regulatory authorities; and thin capitalization and limited product lines, markets, financial resources or personnel. Moreover, stock prices of biotechnology companies are very volatile, particularly when their products are up for regulatory approval and/or under regulatory scrutiny. The biotechnology sector may also be affected by risks that affect the broader health care industry, including expenses and losses from extensive litigation on product liability and similar claims.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on The NASDAQ Stock Market and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether

shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 16.70%

Worst Quarter (ended 9/30/2013): -33.52%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -37.62%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-55.56%	-49.79%	4/7/2010
After Taxes on Distributions	-55.56%	-49.79%	—
After Taxes on Distributions and Sale of Shares	-31.45%	-24.33%	—
NASDAQ Biotechnology Index <sup>#</sup>	34.40%	29.33%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Consumer Goods (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Consumer Goods<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	3.30%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>4.05%</b>
Fee Waiver/Reimbursement*	-3.10%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$948	\$1,815	\$4,056

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of consumer spending in the goods sector of the U.S. equity market. Component companies include, among others, automobiles and auto parts and tires, brewers and distillers, farming and fishing, durable and non-durable household product manufacturers, cosmetic companies, food and tobacco products, clothing, accessories and footwear. As of June 30, 2015, the Index included companies with capitalizations between approximately \$986.6 million and \$212.3 billion. The average capitalization of the companies comprising the Index was approximately \$20.0 billion. The Index is published under the Bloomberg ticker symbol “DJUSNC.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer staples industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap

agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

#### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 12.68%. The Index's highest June to June volatility rate during the five-year period was 17.89% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.37%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Consumer Staples Industry Risk** – The Fund is subject to risks faced by companies in the consumer staples economic sector to the same extent as the Index is so concentrated,

including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, beverage and tobacco related products; and international events that may affect food, beverage and tobacco companies that derive a substantial portion of their net income from foreign countries.

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely

payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare

Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss,

have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2008): 24.59%

Worst Quarter (ended 6/30/2009): -26.33%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -4.73%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-23.68%	-30.96%	-23.29%	1/30/2007
After Taxes on Distributions	-23.68%	-30.96%	-24.11%	—
After Taxes on Distributions and Sale of Shares	-13.40%	-18.59%	-11.71%	—
Dow Jones U.S. Consumer Goods <sup>SM</sup> Index <sup>#</sup>	12.11%	16.50%	10.03%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Consumer Services (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Consumer Services<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.66%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.41%</b>
Fee Waiver/Reimbursement*	-1.46%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$612	\$1,153	\$2,635

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of consumer spending in the services sector of the U.S. equity market. Component companies include, among others, airlines, broadcasting and entertainment, apparel and broadline retailers, food and drug retailers, media agencies, publishing, gambling, hotels, restaurants and bars, and travel and tourism. As of June 30, 2015, the Index included companies with capitalizations between approximately \$560.8 million and \$228.4 billion. The average capitalization of the companies comprising the Index was approximately \$19.5 billion. The Index is published under the Bloomberg ticker symbol “DJUSCY.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer discretionary industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.18%. The Index's highest June to June volatility rate during the five-year period was 22.24% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 23.52%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Consumer Discretionary Industry Risk** – The Fund is subject to risks faced by companies in the consumer discretionary industry to the same extent as the Index is so concentrated, including: the fact that securities prices and profitability may be tied closely to the performance of the domestic and international economy, interest rates, competition and consumer confidence; heavy dependence on disposable household income and consumer spending; severe competition; and changes in demographics and consumer tastes, which can affect the success of consumer products.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely

payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare

Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss,

have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

### Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

#### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2010): 21.10%

Worst Quarter (ended 9/30/2009): -30.27%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -11.32%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-28.25%	-38.72%	-28.77%	1/30/2007
After Taxes on Distributions	-28.25%	-38.72%	-29.87%	—
After Taxes on Distributions and Sale of Shares	-15.99%	-21.20%	-11.63%	—
Dow Jones U.S. Consumer Services <sup>SM</sup> Index <sup>#</sup>	14.53%	21.78%	10.72%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Financials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Financials<sup>SM</sup> Index (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.38%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.13%</b>
Fee Waiver/Reimbursement*	-0.18%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$341	\$605	\$1,359

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the financial services sector of the U.S. equity market. Component companies include: among others, regional banks; major U.S. domiciled international banks; full line, life, and property and casualty insurance companies; companies that invest, directly or indirectly in real estate; diversified financial companies such as Fannie Mae, credit card issuers, check cashing companies, mortgage lenders and investment advisors; securities brokers and dealers including investment banks, merchant banks and online brokers; and publicly traded stock exchanges. As of June 30, 2015, the Index included companies with capitalizations between approximately \$619.9 million and \$336.0 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSFN.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it

would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or

actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 19.85%. The Index's highest June to June volatility rate during the five-year period was 32.78% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.88%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to

financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Regional Banking Industry Risk** – The Fund is subject to risks faced by companies in the banks economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects on profitability due to increases in interest rates or loan losses (which usually increase in economic downturns, which could lead to insolvency or other negative consequences); severe price competition; economic conditions; credit rating downgrades; and increased inter-industry consolidation and competition. This sector has experienced significant losses in the past, and the impact of more stringent capital requirements

and of recent or future regulation on any individual bank or on the sector as a whole cannot be predicted.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and

has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 37.34%

Worst Quarter (ended 6/30/2009): -57.17%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -3.76%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-27.84%	-33.56%	-32.19%	1/30/2007
After Taxes on Distributions	-27.84%	-33.56%	-32.27%	—
After Taxes on Distributions and Sale of Shares	-15.76%	-19.57%	-14.92%	—
Dow Jones U.S. Financials <sup>SM</sup> Index <sup>#</sup>	14.59%	13.89%	-1.17%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Gold Miners (the “Fund”) seeks investment results for a single day only, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the NYSE Arca Gold Miners Index (the “Index”) for that period.

For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls. Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	2.86%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**3.61%**

Fee Waiver/Reimbursement\*\*

-2.66%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$859

The Fund pays transaction costs associated with transacting in securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the period from February 12, 2015 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 0.0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a modified market-capitalization weighted index primarily comprised of publicly traded companies involved in the mining of gold and silver. The weight of companies whose revenues are more significantly exposed to silver mining will not exceed 20% of the Index at the time of the Index's rebalance. As of June 30, 2015, the Index included 40 securities of companies with a market capitalization range of between approximately \$70.6 million and \$13.4 billion and an average market capitalization of \$2.9 billion. The Index is published under the Bloomberg ticker symbol "GDM."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with

aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group and in Canada.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the

reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure;

e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 34.80%. The Index's highest June to June volatility rate during the five-year period was

37.92% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was -18.26%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with

regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day. Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or

denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment linked to a foreign currency is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund’s performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund’s ability to obtain exposure to those foreign investments at appropriate times.

Because certain of the Fund’s foreign investments will include issuers domiciled in developing or “emerging market” countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country’s currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the Fund is exposed to risks associated with investments in Canada. The United States is Canada’s largest trading and investment partner, and the Canadian economy is significantly affected by developments in the U.S. economy. Any downturn in U.S. economic activity is likely to have an adverse impact on the Canadian economy. Among other things, the Canadian economy is heavily dependent on relationships with certain key trading partners, including the U.S., European Union countries and China. Canada is also susceptible to fluctuations in certain commodity markets. Any negative changes in commodity markets could have an adverse impact on the Canadian economy. As such, the Fund is subject to these risks to a much greater degree than funds that do not invest materially in Canadian issuers.

- **Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from

commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.

- **Gold and Silver Mining Industry Risk** – The Fund is subject to risks faced by the gold and silver mining industry, in particular risks related to changes in the price of gold and silver. In addition, changing inflation expectations, the availability of alternatives, such as synthetic substitutes, disruptions in the supply chain, rising production costs, including storage, labor and energy, rising regulatory compliance costs, increased environmental regulations and changes in industrial, government and global consumer demand may adversely affect companies engaged in gold and/or silver related businesses. Depending on market conditions, gold and silver mining companies may dramatically outperform or underperform more traditional equity investments.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund’s shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund’s holdings and the performance of the

Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at

greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since February 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Junior Miners (the “Fund”) seeks investment results for a single day only, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Market Vectors Global Junior Gold Miners Index (the “Index”) for that period.

For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls. Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	3.44%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement*	4.19%
	-3.24%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

0.95%

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* Pursuant to an Expense Limitation Agreement, ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years
\$97	\$976

The Fund pays transaction costs associated with transacting in securities. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the period from February 12, 2015 (the Fund’s inception date) to May 31, 2015, the Fund’s portfolio turnover rate was 0.0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes companies that generate at least 50% of their revenues from (or, in certain circumstances, have at least 50% of their assets related to) gold mining and/or silver mining or have mining projects with the potential to generate at least 50% of their revenues from gold and/or silver when developed. The weight of companies determined to be “silver” stocks will not exceed 20% of the Index at any quarterly rebalance. Between rebalances, however, the weight may exceed 20% due to market appreciation. Such companies may include micro- and small-capitalization companies and foreign issuers. As of June 30, 2015, the Index included 57 securities of companies with a market capitalization range of between approximately \$79.7 million and \$1.6 billion and an average market capitalization of \$537.4 million. The Index is published under the Bloomberg ticker symbol “MVGDXJ.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type,

quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group and in Canada.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in

derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding

will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent.

If Fund expenses and/or actual borrowing/ lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

Estimated Fund Returns							
Index Performance		One Year Volatility Rate					
One Year Index	Two times the inverse (-2x) of the One Year Index						
		10%	25%	50%	75%	100%	
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%	
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%	
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%	
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%	
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%	
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%	
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%	
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%	
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%	
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%	
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%	
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%	
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%	

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%,

absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 39.02%. The Index's highest June to June volatility rate during the five-year period was 43.73% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was -22.96%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting

standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. A U.S. dollar investment in an investment linked to a foreign currency is subject to foreign currency risk. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because certain of the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the Fund is exposed to risks associated with investments in Canada. The United States is Canada's largest

trading and investment partner, and the Canadian economy is significantly affected by developments in the U.S. economy. Any downturn in U.S. economic activity is likely to have an adverse impact on the Canadian economy. Among other things, the Canadian economy is heavily dependent on relationships with certain key trading partners, including the U.S., European Union countries and China. Canada is also susceptible to fluctuations in certain commodity markets. Any negative changes in commodity markets could have an adverse impact on the Canadian economy. As such, the Fund is subject to these risks to a much greater degree than funds that do not invest materially in Canadian issuers.

- **Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.
- **Gold and Silver Mining Industry Risk** – The Fund is subject to risks faced by the gold and silver mining industry, in particular risks related to changes in the price of gold and silver. In addition, changing inflation expectations, the availability of alternatives, such as synthetic substitutes, disruptions in the supply chain, rising production costs, including storage, labor and energy, rising regulatory compliance costs, increased environmental regulations and changes in industrial, government and global consumer demand may adversely affect companies engaged in gold and/or silver related businesses. Depending on market conditions, gold and silver mining companies may dramatically outperform or underperform more traditional equity investments.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the

U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund’s shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund’s holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as a “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- **Small- and Micro-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and micro-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and micro-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and micro-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and micro-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and micro- cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and micro- cap security prices. Micro-cap companies are subject to substantially greater risks of loss and price fluctuations. The shares of micro-cap companies tend to trade less frequently than those of larger, more established companies, which can adversely affect the pricing of these securities and the future ability to sell these securities.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities

markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

### Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since February 2015.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund are generally subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually.

## Important Information About the Fund

ProShares UltraShort Health Care (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Health Care<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	3.64%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>4.39%</b>
Fee Waiver/Reimbursement*	-3.44%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$1,016	\$1,946	\$4,323

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the healthcare sector of the U.S. equity market. Component companies include, among others, health care providers, biotechnology companies, medical supplies, advanced medical devices and pharmaceuticals. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.1 billion and \$270.3 billion. The average capitalization of the companies comprising the Index was approximately \$29.2 billion. The Index is published under the Bloomberg ticker symbol “DJUSHC.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the health care industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap

agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 14.58%. The Index's highest June to June volatility rate during the five-year period was 19.69% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 24.49%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in

the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Health Care Industry Risk** – The Fund is subject to risks faced by companies in the healthcare economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; expenses and losses from extensive litigation based on product liability and similar claims; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting; the long and costly process for obtaining new product approval by the Food and Drug Administration; the difficulty healthcare providers may have obtaining staff to deliver service; susceptibility to product obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel.
- **Pharmaceuticals Industry Risk** – The Fund is subject to the risks faced by companies in the pharmaceuticals economic sector to the same extent as the Index is so concentrated, including: securities prices may fluctuate widely due to government regulation and approval of products and services, which can have a significant effect on their price and availability; heavy spending on research and development for products and services that may not prove commercially successful or may become obsolete quickly; liability for products that are later alleged to be harmful or unsafe may be substantial, which may have a significant impact on market value and/or securities prices; adverse effects from government regulation, world events and economic conditions; and market, economic and political risks of the countries where pharmaceutical companies are located or do business. The pharmaceuticals sector may also be affected by

risks that affect the broader health care industry, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounts; and thin capitalization and limited product lines, markets and financial resources or personnel.

- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a

relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2008): 26.24%

Worst Quarter (ended 3/31/2013): -26.41%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -21.18%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-41.36%	-35.74%	-26.84%	1/30/2007
After Taxes on Distributions	-41.36%	-35.74%	-28.10%	—
After Taxes on Distributions and Sale of Shares	-23.41%	-20.30%	-11.81%	—
Dow Jones U.S. Health Care <sup>SM</sup> Index <sup>#</sup>	25.76%	19.98%	12.08%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Homebuilders & Supplies (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Select Home Construction Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.40%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.15%</b>
Fee Waiver/Reimbursement**	-0.20%

<b>Total Net Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through

September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your Shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$346

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the home construction sector of the U.S. equity market. The Index includes companies that are constructors of residential homes, including manufacturers of mobile and prefabricated homes, as well as producers, sellers and suppliers of building materials, furnishings and fixtures. The companies selected for inclusion in the Index must meet minimum market capitalization and liquidity requirements and have a majority of revenues sourced from residential home construction and remodel related business activities. The Index may include large-, mid- or small capitalization companies, and components primarily include consumer goods, consumer services, home construction and industrials companies.

As of June 30, 2015, the Index was comprised of 41 stocks. The companies included in the Index have an average market capitalization of \$9.1 billion and have capitalizations ranging from \$390.1 million to \$144.4 billion. The components of the Index,

and the degree to which these components represent certain industries, may change over time. The Index is published under the Bloomberg ticker symbol “DJSHMB.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be re-positioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer discretionary industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a

dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/ lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times the inverse (-2x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five year period ended June 30, 2015 was 27.84%. The Index's highest June to June volatility rate during the five year period was 39.91% (June 30, 2012). The Index's annualized total return performance for the five year period ended June 30, 2015 was 20.74%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared**

**Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Consumer Discretionary Industry Risk** – The Fund is subject to risks faced by companies in the consumer discretionary industry to the same extent as the Index is so concentrated, including: the fact that securities prices and profitability may be tied closely to the performance of the domestic and international economy, interest rates, competition and consumer confidence; heavy dependence on disposable household income and consumer spending; severe competition; and changes in demographics and consumer tastes, which can affect the success of consumer products.
- **Homebuilding Industry Risk** – The homebuilding industry, which includes home builders (including manufacturers of mobile and prefabricated homes), as well as producers, sellers and suppliers of building materials, furnishings and fixtures, may be significantly affected by changes in government spending, zoning laws, general economic conditions, interest rates, commodity prices, consumer confidence and spending, taxation, demographic patterns, real estate values, overbuilding, housing starts, and new and existing home sales. Rising interest rates, reductions in mortgage availability to consumers, increasing foreclosure rates or increases in the costs of owning a home could reduce the market for new homes and adversely affect the profitability of home construction companies. Certain segments of the homebuilding industry can be significantly affected by environmental clean-up costs and catastrophic events such as earthquakes, hurricanes and terrorist acts. Home construction companies may lack diversification, due to ownership of a limited number of properties and concentration in a particular geographic region or property type.
- **Industrials Sector Risk** – The value of securities issued by companies in the industrials sector may be adversely affected by

supply and demand related to their specific products or services and industrials sector products in general. The products of manufacturing companies may face obsolescence due to rapid technological developments and frequent new product introduction. Government regulations, world events, economic conditions and exchange rates may adversely affect the performance of companies in the industrials sector. Companies in the industrials sector may be adversely affected by liability for environmental damage and product liability claims.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment

results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capital-

izations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

### Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since June 2015.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell Fund shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund are generally subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Industrials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Industrials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	2.30%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.05%</b>
Fee Waiver/Reimbursement*	-2.10%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$744	\$1,417	\$3,216

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the industrial sector of the U.S. equity market. Component companies include, among others, building materials, heavy construction, factory equipment, heavy machinery, industrial services, pollution control, containers and packaging, industrial diversified, air freight, marine transportation, railroads, trucking, land-transportation equipment, shipbuilding, transportation services, advanced industrial equipment, electric components and equipment, and aerospace. As of June 30, 2015, the Index included companies with capitalizations between approximately \$261.9 million and \$267.7 billion. The average capitalization of the companies comprising the Index was approximately \$12.7 billion. The Index is published under the Bloomberg ticker symbol “DJUSIN.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/ or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s

portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the industrials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the

Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 17.90%. The Index's highest June to June volatility rate during the five-year period was 27.60% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.79%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in

the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Industrial Industry Risk** – The Fund is subject to risks faced by companies in the industrial economic sector to the same extent as the Index is so concentrated, including: effects on stock prices by supply and demand both for their specific product or service and for industrial sector products in general; decline in demand for products due to rapid technological developments and frequent new product introduction; effects on securities prices and profitability from government regulation, world events and economic conditions; and risks for environmental damage and product liability claims.
- **Capital Goods Industry Risk** – The Fund is subject to risks faced by companies in the capital goods industry to the same extent as the Index is so concentrated, including: fluctuations in the business cycle, heavy dependence on corporate spending and by other factors affecting manufacturing demands. The capital goods industry may perform well during times of economic expansion, and as economic conditions worsen, the demand for capital goods may decrease due to weakening demand, worsening business cash flows, tighter credit controls and deteriorating profitability. During times of economic volatility, corporate spending may fall and adversely affect the capital goods industry. This capital goods industry may also be affected by changes in interest rates, corporate tax rates and other government policies. Many capital goods are sold internationally and such companies are subject to market conditions in other countries and regions.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.

- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 43.65%

Worst Quarter (ended 6/30/2009): -37.17%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -2.22%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-18.92%	-35.80%	-28.43%	1/30/2007
After Taxes on Distributions	-18.92%	-35.80%	-30.06%	—
After Taxes on Distributions and Sale of Shares	-10.71%	-20.32%	-11.00%	—
Dow Jones U.S. Industrials <sup>SM</sup> Index <sup>#</sup>	7.30%	17.32%	8.49%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Oil & Gas (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Oil & Gas<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.39%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.14%</b>
Fee Waiver/Reimbursement*	-0.19%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$343	\$609	\$1,369

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the oil and gas sector of the U.S. equity market. Component companies include, among others, exploration and production, integrated oil and gas, oil equipment and services, pipelines, renewable energy equipment companies and alternative fuel producers. As of June 30, 2015, the Index included companies with capitalizations between approximately \$248.4 million and \$347.9 billion. The average capitalization of the companies comprising the Index was approximately \$17.9 billion. The Index is published under the Bloomberg ticker symbol “DJUSEN.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the energy industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 20.88%. The Index's highest June to June volatility rate during the five-year period was 30.24% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 10.43%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or

financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Energy Industry Risk** – The Fund is subject to risks faced by companies in the energy sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where energy companies are located or do business; and risk for environmental damage claims. The energy industry has recently experienced significant volatility due to dramatic changes in the prices of energy commodities, and it is possible that such volatility will continue in the future.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that

represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the

volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2008): 52.94%

Worst Quarter (ended 12/31/2011): -35.13%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 2.08%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	8.44%	-26.85%	-31.51%	1/30/2007
After Taxes on Distributions	8.44%	-26.85%	-32.28%	—
After Taxes on Distributions and Sale of Shares	4.78%	-16.85%	-14.34%	—
Dow Jones U.S. Oil & Gas <sup>SM</sup> Index <sup>#</sup>	-9.27%	8.35%	5.61%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Oil & Gas Exploration & Production (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the S&P Oil & Gas Exploration & Production Select Industry Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.41%
<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.16%</b>
Fee Waiver/Reimbursement**	-0.21%
<b>Total Net Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\*ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be

terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$348

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is equally weighted (as adjusted for diversification and liquidity) and includes domestic companies from the oil and gas exploration and production sub-industry.

As of June 30, 2015, the Index was comprised of 72 stocks. The companies included in the Index have an average market capitalization of \$16.7 billion. Component securities have capitalizations ranging from \$248 million to \$347 billion as of June 30, 2015. The components of the Index, and the degree to which these components represent certain industries, may change over time. The Index is published under the Bloomberg ticker symbol “SPSIOP.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be re-positioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund

should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the energy industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective.

This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/ lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five year period ended June 30, 2015 was 31.23%. The Index's highest June to June volatility rate during the five year period was 44.35% (June 29, 2012). The Index's annualized total return performance for the five year period ended June 30, 2015 was 4.82%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in

the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Energy Industry Risk** – The Fund is subject to risks faced by companies in the energy sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where energy companies are located or do business; and risk for environmental damage claims. The Energy Industry has recently experienced significant volatility due to dramatic changes in the prices of energy commodities, and it is possible that such volatility will continue in the future.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to

acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include,

under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since June 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of

50,000 shares. Retail investors may only purchase and sell Fund shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund are generally subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Real Estate (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Real Estate<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.57%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.32%</b>
Fee Waiver/Reimbursement*	-0.37%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$382	\$688	\$1,558

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the real estate sector of the U.S. equity market. Component companies include, among others, real estate holding and development and real estate services companies and real estate investment trusts (“REITs”). REITs are passive investment vehicles that invest primarily in income producing real estate or real estate related loans or interests. As of June 30, 2015, the Index included companies with capitalizations between approximately \$990.2 million and \$53.9 billion. The average capitalization of the companies comprising the Index was approximately \$7.2 billion. The Index is published under the Bloomberg ticker symbol “DJUSRE.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result,

the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.37%. The Index's highest June to June volatility rate during the five-year period was 28.40% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 13.41%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will

fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Real Estate Investment Trusts Industry Risk** – The Fund is subject to risks faced by companies in the real estate investment trusts industry to the same extent as the Index is so concentrated.

Like the broader real estate industry, REITs may be affected by adverse changes in national, state or local real estate conditions (such as over-supply of or reduced demand for space and changes in market rental rates); obsolescence of properties; changes in the availability, cost and terms of mortgage funds; and the impact of environmental laws. Further, REITs are dependent upon specialized management skills, and their investments may be concentrated in relatively few properties, or in a small geographic area or a single property type. REITs are also subject to heavy cash flow dependency and, as a result, are particularly reliant on the proper functioning of capital markets. REITs may also be affected by the failure to comply with the federal tax requirements affecting REITs which could subject a REIT to federal income taxation; and the risk that the federal tax requirement that a REIT distribute substantially all of its net income to its shareholders could result in a REIT having insufficient capital for future expenditures.

- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 22.00%

Worst Quarter (ended 6/30/2009): -62.33%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 7.11%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-40.86%	-35.32%	-41.98%	1/30/2007
After Taxes on Distributions	-40.86%	-35.32%	-42.23%	—
After Taxes on Distributions and Sale of Shares	-23.13%	-20.17%	-15.52%	—
Dow Jones U.S. Real Estate <sup>SM</sup> Index <sup>#</sup>	27.24%	15.69%	2.71%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Semiconductors (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Semiconductors<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	2.32%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.07%</b>
Fee Waiver/Reimbursement*	-2.12%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$748	\$1,425	\$3,234

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the semiconductor sub-sector of the U.S. equity market. Component companies are engaged in the production of semiconductors and other integrated chips, as well as other related products such as semiconductor capital equipment and mother-boards. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.3 billion and \$144.3 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSSC.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/ or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap

agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%

60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.57%. The Index's highest June to June volatility rate during the five-year period was 28.81% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 16.23%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to

rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's

holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology sector to the same extent as the Index is so concentrated. Securities of technology companies may be subject to greater volatility than stocks of companies in other market sectors. Technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the technology industries as a whole. The information technology sector is also affected by risks that affect the narrower semiconductors sector, including: relying on the economic performance of the customers of

semiconductor companies and their research costs; and risks that their products may not prove commercially successful.

- **Semiconductors Industry Risk** – The Fund is subject to risks faced by companies in the semiconductor industry to the same extent as the Index is so concentrated, including: intense competition, both domestically and internationally, including competition from subsidized foreign competitors with lower production costs; wide fluctuations in securities prices due to risks of rapid obsolescence of products; economic performance of the customers of semiconductor companies, their research costs and the risks that their products may not prove commercially successful; capital equipment expenditures that could be substantial and suffer from rapid obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel. The semiconductors sector may also be affected by risks that affect the broader technology industry, including: government regulation; dramatic and often unpredictable changes in growth rates and competition for qualified personnel; heavy dependence on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability; and a small number of companies representing a large portion of the technology industry as a whole.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results

(before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2008): 39.42%

Worst Quarter (ended 9/30/2009): -35.50%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 0.68%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-52.46%	-36.19%	-32.80%	1/30/2007
After Taxes on Distributions	-52.46%	-36.19%	-33.97%	—
After Taxes on Distributions and Sale of Shares	-29.69%	-20.45%	-11.81%	—
Dow Jones U.S. Semiconductors <sup>SM</sup> Index <sup>#</sup>	36.88%	15.18%	8.27%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and

do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Technology (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Technology<sup>SM</sup> Index (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.85%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.60%</b>
Fee Waiver/Reimbursement*	-1.65%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$651	\$1,232	\$2,811

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the technology sector of the U.S. equity market. Component companies include, among others, those involved in computers and office equipment, software, communications technology, semiconductors, diversified technology services and Internet services. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$30.0 billion. The Index is published under the Bloomberg ticker symbol “DJUSTC.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/ or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result,

the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to

immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%

-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 17.25%. The Index's highest June to June volatility rate during the five-year period was 24.59% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 16.58%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or

financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the

Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology sector to the same extent as the Index is so concentrated. Securities of technology companies may be subject to greater volatility than stocks of companies in other market sectors. Technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the technology industries as a whole. The information technology sector is also affected by risks that affect the narrower semiconductors sector, including: relying on the economic performance of the customers of semiconductor companies and their research costs; and risks that their products may not prove commercially successful.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2008): 35.30%

Worst Quarter (ended 6/30/2009): -34.61%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -5.42%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-35.37%	-31.13%	-28.63%	1/30/2007
After Taxes on Distributions	-35.37%	-31.13%	-29.59%	—
After Taxes on Distributions and Sale of Shares	-20.02%	-18.66%	-12.31%	—
Dow Jones U.S. Technology <sup>SM</sup> Index <sup>#</sup>	20.04%	14.00%	9.59%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort Utilities (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Dow Jones U.S. Utilities<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.91%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.66%</b>
Fee Waiver/Reimbursement*	-1.71%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$663	\$1,257	\$2,866

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index measures the performance of the utilities sector of the U.S. equity market. Component companies include, among others, electric utilities, gas utilities, multi-utilities and water utilities. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.4 billion and \$48.8 billion. The average capitalization of the companies comprising the Index was approximately \$10.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSUT.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/ or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the utilities industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.56%. The Index's highest June to June volatility rate during the five-year period was 16.66% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 12.87%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or

financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties.

During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.

- **Utilities Industry Risk** – The Fund is subject to risks faced by companies in the utilities sector to the same extent as the Index is so concentrated, including: review and limitation of rates by governmental regulatory commissions; the fact that the value of regulated utility instruments tends to have an inverse relationship to the movement of interest rates; the risk that utilities may engage in riskier ventures where they have little or no experience, as deregulation allows utilities to diversify outside of their original geographic regions and their traditional lines of business and greater competition as a result of deregulation, which may adversely affect profitability due to lower operating margins, higher costs and diversification into unprofitable business lines.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2008): 45.95%

Worst Quarter (ended 12/31/2014): -24.12%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 20.18%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-42.80%	-28.06%	-22.48%	1/30/2007
After Taxes on Distributions	-42.80%	-28.06%	-25.08%	—
After Taxes on Distributions and Sale of Shares	-24.22%	-17.39%	-10.22%	—
Dow Jones U.S. Utilities <sup>SM</sup> Index <sup>#</sup>	28.09%	14.03%	7.64%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short Nasdaq Biotechnology (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the NASDAQ Biotechnology Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.43%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.18%</b>
Fee Waiver/Reimbursement**	-0.23%

<b>Total Net Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be

terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your Shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$352

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index is a modified capitalization weighted index that includes securities of NASDAQ listed companies that are classified as either biotechnology or pharmaceutical according to the Industry Classification Benchmark (“ICB”) which also meet other eligibility criteria determined by NASDAQ, including minimum market capitalization and liquidity requirements.

As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.1 million and \$172.1 billion. The average capitalization of the companies comprising the Index was approximately \$7.1 billion. The Index is published under the Bloomberg ticker symbol “NBI.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis, or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be re-positioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the health care industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Health Care Industry Risk** – The Fund is subject to risks faced by companies in the healthcare economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; expenses and losses from extensive litigation based on product liability and similar claims; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting; the long and costly process for obtaining new product approval by the Food and Drug Administration; the difficulty healthcare providers may have obtaining staff to deliver service; susceptibility to product obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel.
- Biotechnology Industry Risk** – The Fund is subject to risks faced by companies in the biotechnology economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patents and intellectual property rights, with profitability affected by the loss or impairment of such rights; risks of new technologies and competitive pressures; large expenditures on research and development of products or services that may not prove commercially successful or may become obsolete quickly; regulations and restrictions imposed by the Food and Drug Administration, the Environmental Protection Agency, state and local governments, and foreign regulatory authorities; and thin capitalization and limited product lines, markets, financial resources or personnel. Moreover, stock prices of biotechnology companies are very volatile, particularly when their products are up for regulatory approval and/or under regulatory scrutiny.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded

over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/ lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Three times the Inverse (-3x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five year period ended June 30, 2015 was 22.33%. The Index's highest June to June volatility rate during the five year period was 27.11% (June 29, 2012). The Index's annualized total return performance for the five year period ended June 30, 2015 was 37.34%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the

securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more

susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on The NASDAQ Stock Market and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less

liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

### **Investment Results**

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### **Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since June 2015.

### **Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell Fund shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### **Tax Information**

Income and capital gain distributions you receive from the Fund are generally subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short Financials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Dow Jones U.S. Financials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	2.39%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.14%</b>
Fee Waiver/Reimbursement*	-2.19%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds. The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$763	\$1,453	\$3,295

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index measures the performance of the financial services sector of the U.S. equity market. Component companies include: among others, regional banks; major U.S. domiciled international banks; full line, life, and property and casualty insurance companies; companies that invest, directly or indirectly in real estate; diversified financial companies such as Fannie Mae, credit card issuers, check cashing companies, mortgage lenders and investment advisors; securities brokers and dealers including investment banks, merchant banks and online brokers; and publicly traded stock exchanges. As of June 30, 2015, the Index included companies with capitalizations between approximately \$619.9 million and \$336.0 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSFN.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry groups.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used

swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance	One Year Volatility Rate				
	Three times the Inverse (-3x) of the One Year Index	10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 19.85%. The Index's highest June to June volatility rate during the five-year period was 32.78% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.88%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or

financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Regional Banking Industry Risk** – The Fund is subject to risks faced by companies in the banks economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects on profitability due to increases in interest rates or loan losses (which usually increase in economic downturns, which could lead to insolvency or other negative consequences); severe price competition; economic conditions; credit rating downgrades; and increased inter-industry consolidation and competition. This sector has experienced significant losses in the past, and the impact of more stringent capital requirements and of recent or future regulation on any individual bank or on the sector as a whole cannot be predicted.

Performance of small and mid-size regional banks may involve greater risk, more volatility and less liquidity than customarily is associated with investments in larger, more established banks. Regional bank securities may have returns that vary, sometimes significantly, from the overall securities market

and/or the overall financial sector. The regional banking industry is highly competitive and failure to maintain or increase market share may result in the loss of market share and decline in market value. The banks sector may also be affected by risks that affect the broader financial services industry.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with

those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments, such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund's investment results during its first full calendar year of operations, and the table shows how

the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31

Best Quarter (ended 09/30/2014): -5.12%

Worst Quarter (ended 3/31/2013): -30.98%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -6.90%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-40.02%	-54.67%	7/10/2012
After Taxes on Distributions	-40.02%	-54.67%	—
After Taxes on Distributions and Sale of Shares	-22.65%	-34.90%	—
Dow Jones U.S. Financials <sup>SM</sup> Index <sup>#</sup>	14.59%	25.17%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Short MSCI EAFE (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the MSCI EAFE Index<sup>®</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (11:30 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.25%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$313	\$548	\$1,220

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as

the inverse (-1x) of the daily return of the Index. The Index includes 85% of free float-adjusted, market capitalization in each industry group in developed market countries, excluding the U.S. and Canada. As of June 30, 2015, the Index consisted of the following 21 developed market country indexes: Australia, Austria, Belgium, Denmark, Finland, France, Germany, Hong Kong, Ireland, Israel, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland, and the United Kingdom. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1 billion and \$232.9 billion. The average capitalization of the companies comprising the Index was approximately \$14.3 billion. The Index is published under the Bloomberg ticker symbol "MXEA."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors

does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group, and in Developed Europe and Developed Asia.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because

derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.72%. The Index's highest June to June volatility rate during the five-year period was 23.46% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 9.53%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high

degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more

susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks issued by companies in European countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, either of which may negatively impact the Fund's returns.

In addition, the Fund is exposed to risks associated with investments in Asia, including, but not limited to: i) political, economic, or social instability in the region, ii) heightened risk of nationalization of companies or other forms of government interference; iii) exposure to less liquid and more volatile securities markets; iv) natural disasters more likely to occur in particular Asian countries; v) heightened exposure to foreign currency risks; and vi) long running border disputes and other conflicts among Asian countries.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse

(-1X) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated

investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from the inverse (-1x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 20.41%

Worst Quarter (ended 6/30/2009): -22.11%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -7.28%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	3.87%	-9.97%	-7.10%	10/23/2007
After Taxes on Distributions	3.87%	-9.97%	-7.86%	—
After Taxes on Distributions and Sale of Shares	2.19%	-7.19%	-4.86%	—
MSCI EAFE Index <sup>#</sup>	-4.90%	5.33%	-0.72%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or

delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short MSCI Emerging Markets (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the MSCI Emerging Markets Index\* (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time. **The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.24%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>0.99%</b>
Fee Waiver/Reimbursement*	-0.04%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$311	\$543	\$1,209

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index includes 85% of free float-adjusted market capitalization in each industry group in emerging market countries. As of June 30, 2015, the Index consisted of the following 23 emerging market country indexes: Brazil, Chile, China, Colombia, Czech Republic, Egypt, Greece, Hungary, India, Indonesia, Korea, Malaysia, Mexico, Peru, Philippines, Poland, Qatar, Russia, South Africa, Taiwan, Thailand, Turkey and United Arab Emirates. As of June 30, 2015, the Index included companies with capitalizations between approximately \$97.8 million and \$125.6 billion. The average capitalization of the companies comprising the Index was approximately \$4.8 billion. The Index is published under the Bloomberg ticker symbol “MXEF.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the

Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in Developed Asia.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a

dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.16%. The Index's highest June to June volatility rate during the five-year period was 22.75% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 3.68%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the

possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular, the Fund is exposed to risks associated with investments in Asia, including, but not limited to: i) political, economic, or social instability in the region, ii) heightened risk of nationalization of companies or other forms of government interference; iii) exposure to less liquid and more volatile securities markets; iv) natural disasters more likely to occur in particular Asian countries; v) heightened exposure to foreign currency risks; and vi) long running border disputes and other conflicts among Asian countries.

Recent events in the Russian Federation may have an adverse impact on the Fund. In response to related political and mili-

tary actions by Russia, the United States and the European Union have instituted numerous sanctions against certain Russian officials and Bank Rossiya. These sanctions, and other intergovernmental actions that may be undertaken against Russia in the future, may cause a decline in the value and liquidity of securities offered by Russian issuers. Future sanctions could, among other actions, directly target transactions in Russian securities, impairing the ability of the Fund to buy, sell, receive, deliver, or obtain exposure to, those securities. While the realization of these actions may benefit the Fund as the Fund seeks daily investment results that correspond to the inverse (-1x) of the Index, because the Fund has exposure to investments in Russia, these events could create liquidity issues and interfere with the ability of the Fund to track its Index.

In addition, the Fund is exposed to risks associated with investments in Latin America, including, but not limited to: i) political, economic, or social instability in certain Latin American countries; ii) a heightened risk of high inflation and government deficits in certain Latin American countries; iii) natural disasters particularly likely to happen in Latin America; iv) heightened risk of currency devaluations; v) risks associated with Latin American economies' significant dependence on the health of the U.S. economy; and vi) risks associated with Latin American economies' sensitivity to fluctuations in the price of commodities such as oil and gas, minerals and metals (resulting from those economies' heavy reliance on the export of such commodities).

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate.

tuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include,

under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from the inverse (-1x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 28.96%

Worst Quarter (ended 6/30/2009): -27.10%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -3.61%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-0.12%	-7.45%	-11.50%	10/30/2007
After Taxes on Distributions	-0.12%	-7.45%	-11.93%	—
After Taxes on Distributions and Sale of Shares	-0.07%	-5.46%	-7.68%	—
MSCI Emerging Markets Index <sup>#</sup>	-2.19%	1.78%	-2.20%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and

do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short FTSE China 50 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the FTSE China 50 Index<sup>®</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (4:15 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.42%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$561	\$1,052	\$2,407

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the

inverse (-1x) of the daily return of the Index. The Index is comprised of 50 of the largest and most liquid Chinese stocks listed on the Hong Kong Stock Exchange. As of June 30, 2015, the Index included companies with capitalizations between approximately \$11.6 billion and \$319.5 billion. The average capitalization of the companies comprising the Index was approximately \$70.2 billion. The Index is published under the Bloomberg ticker symbol "XINOL."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the

assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in China.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due

to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 22.52%. The Index's highest June to June volatility rate during the five-year period was 31.65% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.15%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from

achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Chinese Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in China. Such risks include, but are not limited to (i) political, economic, or social instability in China; (ii) heightened risk of inefficiency, volatility and pricing anomalies of portfolio holdings resulting from governmental influence; (iii) natural disasters particularly likely to occur in China; and (iv) a lack of publicly available information (as compared to many other countries).
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in China, it may be more volatile than a more geographically diversified fund. Investments in the People's Republic of China ("PRC") are subject to special risks, such as less developed or less efficient trading markets, currency fluctuations or blockage, nationalization of assets, limits on repatriation, uncertainty surrounding potential PRC income tax liability, trading suspensions, and the effects of governmental control of markets. In particular, the PRC markets have experienced significant volatility recently. Any actual or perceived reduction to the high levels of growth that the PRC economy and financial markets have experienced in recent years or curtailment in those levels of growth in the future would likely have a substantial adverse impact on the values of PRC companies. Investments in securities of PRC companies

are subject to the PRC's heavy dependence on exports. A small number of companies and industries represent a relatively large portion of the PRC market as a whole. The performance of the Fund will be affected by the political, social and economic conditions in China and subject to the related risks.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- **Telecommunications Industry Risk** – The Fund is subject to risks faced by companies in the telecommunications economic sector to the same extent as the Index is so concentrated, including: a telecommunications market characterized by increasing competition and regulation by the relevant governmental authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete. The telecommunications industry is also affected by

risks that affect the narrower mobile telecommunications sector, including: dramatic securities price fluctuations; recent industry consolidation trends that may lead to increased regulation in primary markets; and thin capitalization and limited product lines, markets financial resources or personnel.
