- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from the inverse (-1x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 32.32%

Worst Quarter (ended 12/31/2011): -16.43%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -13.76%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-15.75%	-11.23%	3/16/2010
After Taxes on Distributions	-15.75%	-11.23%	—
After Taxes on Distributions and Sale of Shares	-8.92%	-8.06%	—
FTSE China 50 Index <sup>#</sup>	13.35%	4.01%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for

all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since March 2010.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MSCI EAFE (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the MSCI EAFE Index<sup>®</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (11:30 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.87%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$655	\$1,240	\$2,830

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes 85% of free float-adjusted, market capitalization in each industry group in developed market countries, excluding the U.S. and Canada. As of June 30, 2015, the Index consisted of the following 21 developed market country indexes: Australia, Austria, Belgium, Denmark, Finland, France, Germany, Hong Kong, Ireland, Israel, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland, and the United Kingdom. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1 billion and \$232.9 billion. The average capitalization of the companies comprising the Index was approximately \$14.3 billion. The Index is published under the Bloomberg ticker symbol "MXEA."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the

Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group, and in Developed Europe and Developed Asia.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk

(each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be

estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.72%. The Index's highest June to June volatility rate during the five-year period was 23.46% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 9.53%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking

positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency

could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns,

which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks issued by companies in European countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, either of which may negatively impact the Fund's returns.

In addition, the Fund is exposed to risks associated with investments in Asia, including, but not limited to: i) political, economic, or social instability in the region, ii) heightened risk of nationalization of companies or other forms of government interference; iii) exposure to less liquid and more volatile securities markets; iv) natural disasters more likely to occur in particular Asian countries; v) heightened exposure to foreign currency risks; and vi) long running border disputes and other conflicts among Asian countries.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below

or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 39.06%

Worst Quarter (ended 6/30/2009): -40.69%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -14.74%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	6.60%	-21.97%	-20.09%	10/23/2007
After Taxes on Distributions	6.60%	-21.97%	-20.91%	—
After Taxes on Distributions and Sale of Shares	3.73%	-14.44%	-10.94%	—
MSCI EAFE Index <sup>#</sup>	-4.90%	5.33%	-0.72%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MSCI Emerging Markets (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the MSCI Emerging Markets Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time. **The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.45%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**1.20%**

Fee Waiver/Reimbursement\*

**-0.25%**

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$356	\$636	\$1,432

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes 85% of free float-adjusted market capitalization in each industry group in emerging market countries. As of June 30, 2015, the Index consisted of the following 23 emerging market country indexes: Brazil, Chile, China, Colombia, Czech Republic, Egypt, Greece, Hungary, India, Indonesia, Korea, Malaysia, Mexico, Peru, Philippines, Poland, Qatar, Russia, South Africa, Taiwan, Thailand, Turkey and United Arab Emirates. As of June 30, 2015, the Index included companies with capitalizations between approximately \$97.8 million and \$125.6 billion. The average capitalization of the companies comprising the Index was approximately \$4.8 billion. The Index is published under the Bloomberg ticker symbol "MXEF."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the

Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in Developed Asia.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference

asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This

effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual

returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in “Principal Risks—Correlation Risk” below.

The Index’s annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.16%. The Index’s highest June to June volatility rate during the five-year period was 22.75% (June 29, 2012). The Index’s annualized total return performance for the five-year period ended June 30, 2015 was 3.68%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests.

The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund’s underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent

or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular, the Fund is exposed to risks associated with investments in Asia, including, but not limited to: i) political, economic, or social instability in the region, ii) heightened risk of nationalization of companies or other forms of government interference; iii) exposure to less liquid and more volatile securities markets; iv) natural disasters more likely to occur in particular Asian countries; v) heightened exposure to foreign currency risks; and vi) long running border disputes and other conflicts among Asian countries.

Recent events in the Russian Federation may have an adverse impact on the Fund. In response to related political and military actions by Russia, the United States and the European Union have instituted numerous sanctions against certain Russian officials and Bank Rossiya. These sanctions, and other intergovernmental actions that may be undertaken against Russia in the future, may cause a decline in the value and liquidity of securities offered by Russian issuers. Future sanctions could, among other actions, directly target transactions in Russian securities, impairing the ability of the Fund to buy, sell, receive, deliver, or obtain exposure to, those securities. While the realization of these actions may benefit the Fund as the Fund seeks daily investment results that correspond to two times the inverse (-2x) of the Index, because the Fund has exposure to investments in Russia, these events could create liquidity issues and interfere with the ability of the Fund to track its Index.

In addition, the Fund is exposed to risks associated with investments in Latin America, including, but not limited to: i) political, economic, or social instability in certain Latin American countries; ii) a heightened risk of high inflation and government deficits in certain Latin American countries; iii) natural disasters particularly likely to happen in Latin America; iv) heightened risk of currency devaluations; v) risks associated with Latin American economies' significant dependence on the health of the U.S. economy; and vi) risks associated with Latin American economies' sensitivity to fluctuations in the price of commodities such as oil and gas, minerals and metals (resulting from those economies' heavy reliance on the export of such commodities).

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
  - **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
  - **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund’s shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund’s holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
  - **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
  - **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
  - **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
  - **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
  - **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.
- Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 59.91%

Worst Quarter (ended 6/30/2009): -48.82%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -8.16%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-2.01%	-18.34%	-32.59%	10/30/2007
After Taxes on Distributions	-2.01%	-18.34%	-32.74%	—
After Taxes on Distributions and Sale of Shares	-1.14%	-12.44%	-15.76%	—
MSCI Emerging Markets Index <sup>#</sup>	-2.19%	1.78%	-2.20%	—

<sup>#</sup>Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort FTSE Europe (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the FTSE Developed Europe Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (4:30 p.m., London Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.46%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

<b>1.21%</b>
<b>-0.26%</b>
<b>0.95%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$358	\$640	\$1,443

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics

as two times the inverse (-2x) of the daily return of the Index. The Index is a free float-adjusted market cap weighted index comprised of large- and mid-cap European stocks, screened for liquidity. As of June 30, 2015, the Index consists of the following 16 developed market countries: Austria, Belgium/Luxembourg, Denmark, Finland, France, Germany, Greece, Ireland, Italy, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.7 billion and \$260.7 billion. The average capitalization of the companies comprising the Index was approximately \$20.9 billion. The Index is published under the Bloomberg ticker symbol "FTADo6."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the

inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the United Kingdom and in Europe.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the

reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time;

d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 17.46%. The Index's highest June to June volatility rate during the five-year period was 17.31% (June 28, 2013). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 10.02%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial

instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Consumer Goods Industry Risk** – The Fund is subject to risks faced by companies in the consumer goods economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the

Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- **Exposure to European Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Europe. Many countries included in the Index are members of the European Union (the “EU”) and all European countries may be significantly affected by EU policies and may be highly dependent on the economies of their fellow members. The European financial markets have experienced significant volatility over recent years and several European countries have been adversely affected by unemployment, budget deficits and economic downturns. In addition, several European countries have experienced credit rating downgrades, rising government debt levels and, for certain European countries (including Greece, Spain, Portugal, Ireland and Italy), weaknesses in sovereign debt. These events, along with decreasing imports or exports, changes in governmental or EU regulations on trade, the default or threat of default by a European country on its sovereign debt and/or an economic recession in a European country may have a significant adverse effect on the affected European country, issuers in the affected European country, the economies of other European countries, their trading partners or other European countries. Such events, or even the threat of such events, may cause the value of securities issued by issuers in such European countries to fall, in some cases drastically. These events may also cause continued volatility in the European financial markets. To the extent that the Fund's assets are exposed to investments from issuers in European countries or denominated in euro, their trading partners, or other European countries, these events may negatively impact the performance of the Fund.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk.

Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Europe, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Europe and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times,

trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue

additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 42.11%

Worst Quarter (ended 9/30/2010): -36.82%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -14.88%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	5.01%	-29.13%	-34.10%	6/16/2009
After Taxes on Distributions	5.01%	-29.13%	-34.10%	—
After Taxes on Distributions and Sale of Shares	2.83%	-17.85%	-18.88%	—
FTSE Developed Europe Index <sup>®##</sup>	-5.65%	5.83%	9.85%	—

# Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for

all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MSCI Pacific ex-Japan (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the MSCI Pacific ex-Japan Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (5:00 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	6.25%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement*	7.00%
	-6.05%

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$1,525	\$2,896	\$6,091

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a free-float-adjusted, market capitalization-weighted index that is designed to measure the equity market performance of the developed markets in the eastern Pacific region, excluding Japan. The Index is divided into large- and mid-cap segments and targets approximately 85% of free float-adjusted market capitalization of the region. As of June 30, 2015, the Index consists of the following 4 developed market countries/cities: Australia, Hong Kong, New Zealand and Singapore. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.2 billion and \$106.1 billion. The average capitalization of the companies comprising the Index was approximately \$10.5 billion. The Index is published under the Bloomberg ticker symbol "MXPCJ."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two

times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group, in Australia and in Asia.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the

Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary

from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected

to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.76%. The Index's highest June to June volatility rate during the five-year period was 25.39% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 8.69%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the

securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular, the Australian economy is heavily dependent on exports from agricultural and mining sectors making it susceptible to fluctuations in the commodity markets. Australia is also dependent on trading with key trading partners.
- Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and

has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or "short" exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 45.13%

Worst Quarter (ended 9/30/2010): -37.71%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -5.54%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-3.25%	-24.12%	-31.74%	6/16/2009
After Taxes on Distributions	-3.25%	-24.12%	-31.74%	—
After Taxes on Distributions and Sale of Shares	-1.84%	-15.54%	-18.14%	—
MSCI Pacific ex-Japan Index <sup>#</sup>	14.66%	8.96%	14.17%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and

do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MSCI Brazil Capped (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the MSCI Brazil 25/50 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage.**

**Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.60%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement*	1.35%
	-0.40%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$388	\$701	\$1,589

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a free-float-adjusted, market capitalization-weighted index that is designed to measure the equity market performance of the Brazilian market. The Index is divided into large- and mid-cap segments and targets approximately 85% of free-float-adjusted market capitalization of the region. The Index is different from the MSCI Brazil Index<sup>®</sup>, as it is designed to limit exposure to large holdings to levels that comply with Internal Revenue Code diversification tests for regulated investment companies. Specifically, a capping methodology is applied that limits the weight of any single component to a maximum of 25% of the Index. Additionally, the sum of the components that individually constitute more than 5% of the weight of the Index cannot exceed a maximum of 50% of the Index in the aggregate. As of June 30, 2015, the Index included companies with capitalizations between approximately \$506.1 million and \$29.1 billion. The average capitalization of the companies comprising the Index was approximately \$4.5 billion. The Index is published under the Bloomberg ticker symbol “MXBR2550.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in Brazil.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a

more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve

a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index was created in November 2012. Since the inception of the Index, the Index's annualized historical volatility rate was 26.19%. The Index's highest June to June volatility rate since inception was 33.66% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was -8.26%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses,

transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Consumer Goods Industry Risk** – The Fund is subject to risks faced by companies in the consumer goods economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Brazilian Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Brazil. Such risks include, but are not limited to (i) legal, regulatory, political and economic risks and (ii) risks related to high rates of inflation and high levels of debt, each of which may hinder economic growth.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the

aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Brazil, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Brazil and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary

market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agree-

ments, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 73.86%

Worst Quarter (ended 9/30/2010): -38.43%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 3.30%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	2.43%	-2.48%	-17.62%	6/16/2009
After Taxes on Distributions	2.43%	-2.48%	-17.62%	—
After Taxes on Distributions and Sale of Shares	1.38%	-1.87%	-11.81%	—
MSCI Brazil 25/50 Index <sup>#</sup>	-14.05%	-9.47%	-2.33%*	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

\* Cumulative Total Return from 11/21/2012 (the inception date of the Index) to 12/31/2014.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and

do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since April 2010.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort FTSE China 50 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the FTSE China 50 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (4:15 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.43%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement*	1.18%
---------------------------	-------

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised, by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$352	\$627	\$1,411

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is comprised of 50 of the largest and most liquid Chinese stocks listed on the Hong Kong Stock Exchange. As of June 30, 2015, the Index included companies with capitalizations between approximately \$11.6 billion and \$319.5 billion. The average capitalization of the companies comprising the Index was approximately \$70.2 billion. The Index is published under the Bloomberg ticker symbol "XINOI."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on

ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in China.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because

derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with

respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 22.52%. The Index's highest June to June volatility rate during the five-year period was 31.65%

(June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.15%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be

subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and the changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index may hinder the Fund's ability to meet its daily investment objective on or around that day. Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Chinese Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in China. Such risks include, but are not limited to (i) political, economic, or social instability in China; (ii) heightened risk of inefficiency, volatility and pricing anomalies of portfolio holdings resulting from governmental influence; (iii) natural disasters particularly likely to occur in China; and (iv) a lack of publicly available information (as compared to many other countries).

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial

company or recent or future regulation on the financials economic sector as a whole cannot be predicted.

- **Geographic Concentration Risk** – Because the Fund focuses its investments only in China, it may be more volatile than a more geographically diversified fund. Investments in the People's Republic of China ("PRC") are subject to special risks, such as less developed or less efficient trading markets, currency fluctuations or blockage, nationalization of assets, limits on repatriation, uncertainty surrounding potential PRC income tax liability, trading suspensions, and the effects of governmental control of markets. In particular, the PRC markets have experienced significant volatility recently. Any actual or perceived reduction to the high levels of growth that the PRC economy and financial markets have experienced in recent years or curtailment in those levels of growth in the future would likely have a substantial adverse impact on the values of PRC companies. Investments in securities of PRC companies are subject to the PRC's heavy dependence on exports. A small number of companies and industries represent a relatively large portion of the PRC market as a whole. The performance of the Fund will be affected by the political, social and economic conditions in China and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when

NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available secu-

rities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Telecommunications Industry Risk** – The Fund is subject to risks faced by companies in the telecommunications economic sector to the same extent as the Index is so concentrated, including: a telecommunications market characterized by increasing competition and regulation by the relevant governmental authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete. The telecommunications industry is also affected by risks that affect the narrower mobile telecommunications sector, including: dramatic securities price fluctuations; recent industry consolidation trends that may lead to increased regulation in primary markets; and thin capitalization and limited product lines, markets financial resources or personnel.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 68.78%

Worst Quarter (ended 12/31/2008): -61.25%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -27.43%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-30.91%	-24.08%	-38.58%	11/6/2007
After Taxes on Distributions	-30.91%	-24.08%	-38.62%	—
After Taxes on Distributions and Sale of Shares	-17.50%	-15.52%	-17.01%	—
FTSE China 50 Index <sup>#</sup>	13.35%	2.77%	-3.00%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax

returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MSCI Japan (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the MSCI Japan Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (2:10 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.01%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

<b>1.76%</b>
<b>-0.81%</b>
<b>0.95%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$475	\$878	\$2,006

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes 85% of free-float adjusted, market capitalization in each industry group in Japan. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1 billion and \$183.3 billion. The average capitalization of the companies comprising the Index was approximately \$9.5 billion. The Index is published under the Bloomberg ticker symbol "MXJP."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets

of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in Japan.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because

derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with

respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.63%. The Index's highest June to June volatility rate during the five-year period was

21.40% (June 30, 2011). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 8.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with

regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Consumer Services Industry Risk** – The Fund is subject to risks faced by companies in the consumer services industry to the same extent as the Index is so concentrated, including: the fact that securities prices and profitability may be tied closely to the performance of the domestic and international economy, interest rates, competition and consumer confidence; heavy dependence on disposable household income and consumer spending; severe competition; and changes in demographics and consumer tastes, which can affect the success of consumer products.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking

investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Exposure to Japanese Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Japan. Such risks include, but are not limited to (i) political, economic, or social instability in Japan; (ii) risks associated with Japan's large government deficit; (iii) natural disasters particularly likely to occur in Japan; and (iv) risks associated with an increasingly aging population that is likely to strain Japan's social welfare and pension systems.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Japan, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Japan and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's

stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily net asset value NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”)

accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2009): 29.19%

Worst Quarter (ended 6/30/2009): -34.23%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -26.83%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	3.36%	-19.79%	-16.58%	11/6/2007
After Taxes on Distributions	3.36%	-19.79%	-17.19%	—
After Taxes on Distributions and Sale of Shares	1.90%	-13.26%	-10.15%	—
MSCI Japan Index <sup>#</sup>	-4.02%	5.48%	-0.77%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or

delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort MSCI Mexico Capped IMI (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the MSCI Mexico IMI 25/50 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure, and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time. **The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	8.37%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

9.12%

-8.17%

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$1,917	\$3,591	\$7,208

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index is a free float-adjusted, market capitalization-weighted index that is designed to measure the equity market performance of the Mexican market by capturing 99% of the (publicly available) total market capitalization. Component companies must meet objective criteria for inclusion in the MSCI Mexico Investable Market Index®, taking into consideration unavailable strategic shareholdings and limitations to foreign ownership. The Index is different from the MSCI Mexico Investable Market Index®, as it is designed to limit exposure to large holdings to levels that comply with Internal Revenue Code diversification tests for regulated investment companies. Specifically, a capping methodology is applied that limits the weight of any single component to a maximum of 25% of the Index. Additionally, the sum of the components that individually constitute more than 5% of the weight of the Index cannot exceed a maximum of 50% of the Index in the aggregate. As of June 30, 2015, the Index included companies with capitalizations between approximately \$550.2 million and \$32.1 billion. The average capitalization of the companies comprising the Index was approximately \$3.5 billion. The Index is published under the Bloomberg ticker symbol “MXMX5IM.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting stocks in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified

time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer staples industry group and in Mexico.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### **You could lose money by investing in the Fund.**

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond

to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in

the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index was created in November 2012. Since the inception of the Index, the Index's annualized historical volatility rate was 20.11%. The Index's highest June to June volatility rate since inception was 28.37% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 4.92%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Consumer Staples Industry Risk** – The Fund is subject to risks faced by companies in the consumer staples economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to

developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Exposure to Mexican Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Mexico. Such risks include, but are not limited to (i) legal, regulatory and political instability in Mexico; (ii) high interest rates; (iii) economic volatility; (iv) high unemployment; (v) the Mexican economy is dependent upon external trade causing increased risk to the Mexican economy; and (vi) risk related to increased violence related to drug trafficking which could have an adverse effect on the Mexican economy and financial markets.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Mexico, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Mexico and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times,

trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily net asset value NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties.

During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times the inverse (-2x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 42.17%

Worst Quarter (ended 12/31/2010): -29.85%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.22%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	15.60%	-25.49%	-33.78%	6/16/2009
After Taxes on Distributions	15.60%	-25.49%	-33.78%	—
After Taxes on Distributions and Sale of Shares	8.83%	-16.21%	-18.79%	—
MSCI Mexico IMI 25/50 Index <sup>#</sup>	-9.81%	5.34%	3.77%	—

# Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for

all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Short 7-10 Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Barclays U.S. 7-10 Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.33%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.08%</b>
Fee Waiver/Reimbursement*	-0.13%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$331	\$583	\$1,305

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity of between 7 and 10 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPS”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LT09TRUU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to

immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing /lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 6.36%. The Index's highest June to June volatility rate during the five-year period was 7.41% (June 30, 2011). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 4.28%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high

degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In

addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund

currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below,

ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2013): 3.92%

Worst Quarter (ended 6/30/2012): -5.07%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.90%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-9.69%	-7.00%	4/4/2011
After Taxes on Distributions	-9.69%	-7.00%	—
After Taxes on Distributions and Sale of Shares	-5.49%	-5.20%	—
Barclays U.S. 7-10 Year Treasury Bond Index <sup>#</sup>	9.00%	5.76%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since April 2011.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short 20+ Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Barclays U.S. 20+ Year Treasury Bond Index (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.20%
<b>Total Annual Fund Operating Expenses*</b>	<b>0.95%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$303	\$525	\$1,166

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity greater than 20 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPs”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LT11TRUU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

directly shorting debt in order to gain inverse exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result,

the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion

of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/ lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or borrowing lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Inverse (-1x) of the One Year Index	10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 14.97%. The Index's highest June to June volatility rate during the five-year period was 20.09% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.50%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from

achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In

addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces

a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of

the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2010): 8.99%

Worst Quarter (ended 9/30/2011): -24.14%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 3.64%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-23.43%	-12.96%	-11.98%	8/18/2009
After Taxes on Distributions	-23.43%	-12.96%	-11.98%	—
After Taxes on Distributions and Sale of Shares	-13.26%	-9.16%	-8.46%	—
Barclays U.S. 20+ Year Treasury Bond Index#	27.48%	10.68%	9.35%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since August 2009.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short High Yield (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Markit iBoxx \$ Liquid High Yield Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on that day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 p.m.) and valuation of the Fund (4:00 p.m.). As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.35%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.10%</b>
Fee Waiver/Reimbursement*	-0.15%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to

reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$335	\$592	\$1,327

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as the inverse (-1x) of the daily return of the Index. The Index is a modified market-value weighted index designed to provide a balanced representation of U.S. dollar-denominated high yield corporate bonds for sale within the United States by means of including the most liquid high yield corporate bonds available as determined by the index provider. Currently, the bonds eligible for inclusion in the Index include U.S. dollar-denominated, corporate bonds for sale in the United States that are issued by companies domiciled in the U.S., Bermuda, Canada, Cayman Islands, Western Europe or Japan; are rated sub-investment grade by Moody’s Investors Service, Inc., Fitch, Inc. or Standard and Poor’s Financial Services, LLC; are from issuers with at least

\$1 billion par outstanding; have at least \$400 million of outstanding face value; and are between three and fifteen years to maturity. There is no limit to the number of issues in the Index. Index rebalances occur monthly. The Index is published under the Bloomberg ticker symbol "IBOXHY."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without

regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may

not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Inverse (-1x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 4.20%. The Index's highest June to June volatility rate during the five-year period was 6.80% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 7.78%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a

high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 pm) and the valuation of the Fund (4:00 pm).

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all bonds in the Index, or its weighting of investment exposure to bonds may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely

payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of credit risk of such securities.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **High Yield Risk** – Investment in or exposure to high yield (lower rated) debt instruments (also known as "junk bonds") may involve greater levels of credit, prepayment, liquidity and valuation risk than for higher rated instruments. High yield debt instruments may be more sensitive to economic changes, political changes, or adverse developments specific to a company than other fixed income instruments. These securities are subject to greater risk of loss, greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market for securities. High yield debt instruments are considered speculative with respect to the issuer's continuing ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than higher rated debt instruments. An economic downturn or period of rising interest rates could adversely affect the market for these securities and reduce market liquidity (liquidity risk). Less active markets may diminish the Fund's ability to obtain accurate market quotations when valuing the portfolio securities and thereby give rise to valuation risk. High yield debt instruments may also present risks based on payment expectations. For example, these instruments may contain redemption or call provisions. If an issuer exercises these provisions in a declining interest rate market, the Fund would have to replace the security with a lower yielding security, resulting in a decreased return for investors. If the issuer of a security is in default with respect to interest or principal payments, the issuer's security could lose its entire value. Furthermore, the transaction costs associated with the purchase and sale of high yield debt instruments may vary greatly depending upon a number of factors and may adversely affect the Fund's performance.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related/certain financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.).

This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and

redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). Bond markets typically close before such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from the inverse (-1x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2014): 1.44%

Worst Quarter (ended 12/31/2013): -4.09%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -2.58%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-4.74%	-8.98%	3/21/2011
After Taxes on Distributions	-4.74%	-8.98%	—
After Taxes on Distributions and Sale of Shares	-2.69%	-6.62%	—
Markit iBoxx \$ Liquid High Yield Index <sup>#</sup>	2.13%	6.36%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since March 2011.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Short Investment Grade Corporate (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Markit iBoxx \$ Liquid Investment Grade Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, and inverse exposure each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on that day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 p.m.) and valuation of the Fund (4:00 p.m.). As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks returns inverse to the Index and only on a daily basis. The Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to the inverse (-1x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	4.00%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

<b>4.75%</b>
<b>-3.80%</b>
<b>0.95%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$1,088	\$2,084	\$4,595

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics

as the inverse (-1x) of the daily return of the Index. The Index is a modified market-value weighted index designed to provide a balanced representation of U.S. dollar-denominated investment grade corporate bonds publicly offered in the United States by means of including the most liquid investment grade corporate bonds available as determined by the index provider. Currently, the bonds eligible for inclusion in the Index include U.S. dollar-denominated corporate bonds publicly offered in the United States that are issued by companies domiciled in the U.S., Bermuda, Canada, Cayman Islands, Western Europe or Japan; are rated investment grade by Moody's Investors Service, Inc., Fitch, Inc. or Standard and Poor's Financial Services, LLC; are from issuers with at least \$3 billion par outstanding; have at least \$750 million of outstanding face value; and have at least three years remaining to maturity. There is no limit to the number of issues in the Index. Index rebalances occur monthly. The Index is published under the Bloomberg ticker symbol "IBOXIG."

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of the

inverse (-1x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund's inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund's inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from the inverse (-1x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financial services industry group.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference

asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from the inverse (-1x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than the inverse (-1x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Inverse (-1x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	60%	147.5%	134.9%	94.7%	42.4%	-8.0%
-50%	50%	98.0%	87.9%	55.8%	14.0%	-26.4%
-40%	40%	65.0%	56.6%	29.8%	-5.0%	-38.7%
-30%	30%	41.4%	34.2%	11.3%	-18.6%	-47.4%
-20%	20%	23.8%	17.4%	-2.6%	-28.8%	-54.0%
-10%	10%	10.0%	4.4%	-13.5%	-36.7%	-59.1%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	-10%	-10.0%	-14.6%	-29.2%	-48.2%	-66.6%
20%	-20%	-17.5%	-21.7%	-35.1%	-52.5%	-69.3%
30%	-30%	-23.8%	-27.7%	-40.1%	-56.2%	-71.7%
40%	-40%	-29.3%	-32.9%	-44.4%	-59.3%	-73.7%
50%	-50%	-34.0%	-37.4%	-48.1%	-62.0%	-75.5%
60%	-60%	-38.1%	-41.3%	-51.3%	-64.4%	-77.0%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -20% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -35.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 4.65%. The Index's highest June to June volatility rate during the five-year period was 5.25% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 7.78%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from the inverse (-1x) of the percentage change of the Index on such day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 pm) and the valuation of the Fund (4:00 pm).

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -1x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all bonds in the Index, or its weighting of investment exposure to bonds may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of credit risk of such securities.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than

markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

- **Financial Services Industry Risk** – The Fund is subject to risks faced by companies in the financial services economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financial sector.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related/certain financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to the inverse (-1x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday

position of the Fund will generally be different from the Fund's stated investment objective of the inverse (-1x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company

under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse exposure consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund’s return, result in a loss, have the effect of limiting the Fund’s ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund’s short positions will negatively impact the Fund.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). Bond markets typically close before such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from the inverse (-1x) of the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2013): 3.83%

Worst Quarter (ended 9/30/2012): -4.83%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 0.54%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-9.69%	-8.46%	3/28/2011
After Taxes on Distributions	-9.69%	-8.46%	—
After Taxes on Distributions and Sale of Shares	-5.49%	-6.25%	—
Markit iBoxx \$ Liquid Investment Grade Index <sup>#</sup>	8.66%	6.84%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse investment results (i.e., -1x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since March 2011.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit

or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort 3-7 Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Barclays U.S. 3-7 Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	2.48%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>3.23%</b>
Fee Waiver/Reimbursement*	-2.28%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$781	\$1,490	\$3,374

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes all publicly issued U.S. Treasury securities that have a remaining maturity of more than three years and less than seven years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPs”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LT13TRUU”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to

immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 3.34%. The Index's highest June to June volatility rate during the five-year period was 4.40% (June 30, 2011). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 2.69%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary

policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to the inverse (-2x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares

will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2013): 3.74%

Worst Quarter (ended 6/30/2012): -3.84%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -3.40%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-8.06%	-7.48%	4/4/2011
After Taxes on Distributions	-8.06%	-7.48%	—
After Taxes on Distributions and Sale of Shares	-4.56%	-5.55%	—
Barclays U.S. 3-7 Year Treasury Bond Index <sup>#</sup>	3.22%	3.05%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since March 2011.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort 7-10 Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Barclays U.S. 7-10 Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.23%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>0.98%</b>
Fee Waiver/Reimbursement*	-0.03%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors

within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$309	\$539	\$1,199

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity of between 7 and 10 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPs”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LTo9TRUU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index

without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a

dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Two times the inverse (-2x) of the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 6.36%. The Index's highest June to June volatility rate during the five-year period was 7.41% (June 30, 2011). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 4.28%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the**

**Fund' Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to

financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after

the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties.

During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2009): 8.44%

Worst Quarter (ended 9/30/2011): -18.44%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -1.62%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-17.94%	-14.40%	-14.36%	4/29/2008
After Taxes on Distributions	-17.94%	-14.40%	-14.37%	—
After Taxes on Distributions and Sale of Shares	-10.15%	-10.07%	-9.62%	—
Barclays U.S. 7-10 Year Treasury Bond Index#	9.00%	6.16%	5.70%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since April 2008.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort 20+ Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Barclays U.S. 20+ Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.18%
<b>Total Annual Fund Operating Expenses*</b>	<b>0.93%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$95	\$296	\$515	\$1,143

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity greater than 20 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPS”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LT11TRUU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 14.97%. The Index's highest June to June volatility rate during the five-year period was 20.09% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.50%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to

perform its obligations, the value of an investment in the Fund may decline.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.

- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after

the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties.

During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2010): 17.87%

Worst Quarter (ended 9/30/2011): -43.24%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 6.27%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-41.39%	-25.30%	-23.56%	4/29/2008
After Taxes on Distributions	-41.39%	-25.30%	-23.57%	—
After Taxes on Distributions and Sale of Shares	-23.43%	-16.12%	-14.01%	—
Barclays U.S. 20+ Year Treasury Bond Index#	27.48%	10.68%	8.64%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since April 2008.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraShort TIPS (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Barclays U.S. Treasury Inflation-Protected Securities (“TIPS”) Index (Series L) (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times the inverse (-2x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.00%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.75%</b>
Fee Waiver/Reimbursement*	-0.80%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$473	\$874	\$1,996

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times the inverse (-2x) of the daily return of the Index. The Index includes all publicly issued, U.S. Treasury inflation-protected securities (“TIPS”) that have at least one year remaining maturity, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million or more par value outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria and the securities of the Index are updated on the last calendar day of each month. TIPS are the inflation indexed bonds issued by the U.S. Treasury. The principal is adjusted by a designated inflation index, such as the consumer price index, the commonly used measure of inflation. The coupon rate is constant, but generates a different amount of interest when multiplied by the inflation-adjusted principal, thus protecting the holder against inflation. The Index is published under the Bloomberg ticker symbol “LBUTTRUU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times the inverse (-2x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods. At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its

exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times the inverse (-2x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap

agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the inverse (-2x) of the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times the inverse (-2x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times the inverse (-2x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times the inverse (-2x) of the One Year Index	10%	25%	50%	75%	100%
-60%	120%	506.5%	418.1%	195.2%	15.6%	-68.9%
-50%	100%	288.2%	231.6%	88.9%	-26.0%	-80.1%
-40%	80%	169.6%	130.3%	31.2%	-48.6%	-86.2%
-30%	60%	98.1%	69.2%	-3.6%	-62.2%	-89.8%
-20%	40%	51.6%	29.5%	-26.2%	-71.1%	-92.2%
-10%	20%	19.8%	2.3%	-41.7%	-77.2%	-93.9%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	-20%	-19.8%	-31.5%	-61.0%	-84.7%	-95.9%
20%	-40%	-32.6%	-42.4%	-67.2%	-87.2%	-96.5%
30%	-60%	-42.6%	-50.9%	-72.0%	-89.1%	-97.1%
40%	-80%	-50.5%	-57.7%	-75.9%	-90.6%	-97.5%
50%	-100%	-56.9%	-63.2%	-79.0%	-91.8%	-97.8%
60%	-120%	-62.1%	-67.6%	-81.5%	-92.8%	-98.1%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -67.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 5.57%. The Index's highest June to June volatility rate during the five-year period was 6.32% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 3.29%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of inverse correlation with the

Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times the inverse (-2x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The TIPS and U.S. Treasury markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally decrease when market conditions cause the level of the Index to rise.
- **Inflation-Indexed Security Risk** – The value of an inflation-indexed security (such as TIPS) tends to decrease when real interest rates increase, and tend to increase when real interest rates

decrease. Real interest rates are generally measured as a nominal interest rate less an inflation rate. As such, investors should be aware that a short position in TIPS over a particular timeframe may decrease in value due to falling real rates even in a deflationary environment.

- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to two times the inverse (-2x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times the inverse (-2x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of

their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Risk of Limited Gains** – TIPS include a “deflation floor” which limits potential losses on the securities during deflationary periods (i.e., even if inflation is sufficiently negative to otherwise reduce the value of the bond below the floor price, the value of the security at maturity will remain at the floor price). As such, the market price of TIPS securities are unlikely to drop beneath this floor level, which may limit declines in the level of the Index and, by extension, gains in the value of the Fund.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include,

under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2013): 15.11%

Worst Quarter (ended 6/30/2014): -7.49%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -1.54%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-8.11%	-9.04%	2/9/2011
After Taxes on Distributions	-8.11%	-9.04%	—
After Taxes on Distributions and Sale of Shares	-4.59%	-6.65%	—
Barclays U.S. Treasury Inflation-Protected Securities (TIPS) Index (Series L) <sup>#</sup>	3.64%	4.04%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since March 2011.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Short 20+ Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Barclays U.S. 20+ Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index falls.** Longer holding periods, higher index volatility, inverse exposure and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks inverse leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times the inverse (-3x) of the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.27%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.02%</b>
Fee Waiver/Reimbursement*	-0.07%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$318	\$556	\$1,241

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times the inverse (-3x) of the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity greater than 20 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPS”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LT11TRUU.”

The derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for directly shorting debt in order to gain inverse leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times the inverse (-3x) of the Index. The Fund may gain inverse exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the inverse of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide inverse leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should fall. As a result, the Fund’s inverse exposure will need to be decreased. Conversely, if the Index has fallen on a given day, net assets of the Fund should rise. As a result, the Fund’s inverse exposure will need to be increased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times the inverse (-3x) of the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index falls, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

While the realization of certain of these risks may benefit the Fund because the Fund seeks investment results that correspond to the inverse or a multiple of the inverse of the Index, such occurrences may introduce more volatility to the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to

immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times the inverse (-3x) of the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on an inverse leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times the inverse (-3x) of the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with inverse leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain inverse leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times the inverse (-3x) of the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Three times the Inverse (-3x) of the One Year Index					
		10%	25%	50%	75%	100%
-60%	180%	1371.5%	973.9%	248.6%	-46.5%	-96.1%
-50%	150%	653.4%	449.8%	78.5%	-72.6%	-98.0%
-40%	120%	336.0%	218.2%	3.3%	-84.2%	-98.9%
-30%	90%	174.6%	100.4%	-34.9%	-90.0%	-99.3%
-20%	60%	83.9%	34.2%	-56.4%	-93.3%	-99.5%
-10%	30%	29.2%	-5.7%	-69.4%	-95.3%	-99.7%
0%	0%	-5.8%	-31.3%	-77.7%	-96.6%	-99.8%
10%	-30%	-29.2%	-48.4%	-83.2%	-97.4%	-99.8%
20%	-60%	-45.5%	-60.2%	-87.1%	-98.0%	-99.9%
30%	-90%	-57.1%	-68.7%	-89.8%	-98.4%	-99.9%
40%	-120%	-65.7%	-75.0%	-91.9%	-98.8%	-99.9%
50%	-150%	-72.1%	-79.6%	-93.4%	-99.0%	-99.9%
60%	-180%	-77.0%	-83.2%	-94.6%	-99.2%	-99.9%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were 20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -87.1% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 14.97%. The Index's highest June to June volatility rate during the five-year period was 20.09% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.50%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of inverse correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of inverse correlation. Failure to achieve a high degree of inverse correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times the inverse (-3x) of the percentage change of the Index on such day.

In order to achieve a high degree of inverse correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of inverse correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect inverse exposure (i.e., -3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s inverse correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and other Index rebalancing events. Additionally, the Fund’s underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors. As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund’s performance will generally decrease when market conditions cause the level of the Index to rise.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary

policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

As a fund seeking investment results that correspond to three times the inverse (-3x) of the Index, the Fund's performance will generally be more favorable when interest rates rise and less favorable when interest rates decline.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times the inverse (-3x) of the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Inverse Correlation Risk** – Shareholders will lose money when the Index rises—a result that is the opposite from traditional funds.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high inverse correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares

will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in financial instruments with a single counterparty or a few counterparties. This may cause the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep inverse leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Short Sale Exposure Risk** – The Fund may seek inverse or “short” exposure through financial instruments such as swap agreements and futures contracts, which may cause the Fund to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities underlying the short position, which may lower the Fund's return, result in a loss, have the effect of limiting the Fund's ability to obtain inverse exposure through financial instruments such as swap agreements and futures contracts, or require the Fund to seek inverse exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities underlying the short position may be thinly traded or have a limited market, including due to regulatory action, the Fund may be unable to meet its investment objective due to a lack of available securities or counterparties. During such periods, the Fund's ability to issue additional Creation Units may be adversely affected. Obtaining inverse exposure through these instruments may be considered an aggressive investment technique. Any income, dividends or

payments by the assets underlying the Fund's short positions will negatively impact the Fund.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund's investment results during its first full calendar year of operations, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31

Best Quarter (ended 6/30/2013): 15.49%

Worst Quarter (ended 12/31/2014): -25.30%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 7.58%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-55.62%	-26.85%	3/27/12
After Taxes on Distributions	-55.62%	-26.85%	—
After Taxes on Distributions and Sale of Shares	-31.48%	-18.97%	—
Barclays U.S. 20+ Year Treasury Bond Index <sup>#</sup>	27.48%	7.07%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account.

After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily inverse leveraged investment results (i.e., -3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since March 2012.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra S&P500 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the S&P 500® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.14%
<b>Total Annual Fund Operating Expenses*</b>	<b>0.89%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your

investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$91	\$284	\$493	\$1,096

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 31% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a measure of large-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 500 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$3.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$39.3 billion. The Index is published under the Bloomberg ticker symbol “SPX.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period

ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.

- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer**

**than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund

that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.17 %. The Index's highest June to June volatility rate during the five-year period was 23.54% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.33%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes

that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 32.16%

Worst Quarter (ended 12/31/2008): -46.28%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 0.99%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Year	Since Inception	Inception Date
Before Taxes	25.62%	28.09%	9.19%	6/19/2006
After Taxes on Distributions	25.52%	27.96%	8.71%	—
After Taxes on Distributions and Sale of Shares	14.58%	23.40%	7.26%	—
S&P 500®#	13.69%	15.45%	8.41%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra QQQ (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the NASDAQ-100 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.26%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.01%</b>
Fee Waiver/Reimbursement*	-0.06%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$316	\$552	\$1,231

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 8% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index, a modified market capitalization-weighted index, includes 100 of the largest non-financial domestic and international issues listed on The NASDAQ Stock Market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$5.6 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$55.3 billion. The Index is published under the Bloomberg ticker symbol “NDX.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s

portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.67%. The Index's highest June to June volatility rate during the five-year period was 24.08% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 21.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes

that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology industry to the same extent as the Index is so concentrated. Securities of information technology companies may be subject to greater volatility than stocks of companies in other market sectors. Like other technology companies, information technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Information technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the information technology industries as a whole. The information technology industry may also be affected by risks that affect the telecommunications industry, including a telecommunications market characterized by increasing competition and regulation by the Federal Communications Commission and various state regulatory authorities; the

need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 03/31/2012): 46.06%

Worst Quarter (ended 12/31/2008): -48.57%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 7.08%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	37.52%	35.88%	18.97%	6/19/2006
After Taxes on Distributions	37.45%	35.84%	18.43%	—
After Taxes on Distributions and Sale of Shares	21.28%	30.37%	15.79%	—
NASDAQ-100 Index <sup>#</sup>	19.40%	19.22%	13.51%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to invest-

ors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Dow30 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones Industrial Average<sup>SM</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.23%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>0.98%</b>
Fee Waiver/Reimbursement*	-0.03%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$309	\$539	\$1,199

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 9% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a price-weighted index and includes 30 large-cap, “blue-chip” U.S. stocks, excluding utility and transportation companies. Components are selected through a discretionary process with no predetermined criteria except that components should be established U.S. companies that are leaders in their industries, have an excellent reputation, demonstrate sustained growth, are of interest to a large number of investors and accurately represent the sectors covered by the average. The Index is not limited to traditionally defined industrial stocks; instead, the Index serves as a measure of the entire U.S. market, covering such diverse industries as financial services, technology, retail, entertainment and consumer goods. Composition changes are rare, and generally occur only after corporate acquisitions or other dramatic shifts in a component’s core business. When such an event necessitates the replacement of one component, the entire Index is reviewed. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.8 billion and \$722.6 billion. The average capitalization of the companies

comprising the Index was approximately \$180.7 billion. The Index is published under the Bloomberg ticker symbol “INDU.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the

assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with

respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.97%. The Index's highest June to June volatility rate during the five-year period was 21.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 15.40%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in

the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s

holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 32.85%

Worst Quarter (ended 12/31/2008): -40.44%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -1.45%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Year	Since Inception	Inception Date
<b>Before Taxes</b>	17.94%	25.88%	10.53%	6/19/2006
<b>After Taxes on Distributions</b>	17.70%	25.75%	9.83%	—
<b>After Taxes on Distributions and Sale of Shares</b>	10.32%	21.46%	8.29%	—
<b>Dow Jones Industrial Average<sup>SM</sup></b>	10.04%	14.22%	8.70%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MidCap400 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the S&P MidCap 400® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.21%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>0.96%</b>
Fee Waiver/Reimbursement*	-0.01%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$305	\$530	\$1,177

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 56% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a measure of mid-size company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 400 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$11.7 billion. The average capitalization of the companies comprising the Index was approximately \$4.2 billion. The Index is published under the Bloomberg ticker symbol “MID.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The

Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective.

This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.10%. The Index's highest June to June volatility rate during the five-year period was 29.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.81%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation

may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities

would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have

greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 41.81%

Worst Quarter (ended 12/31/2008): -52.35%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 7.04%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	15.92%	28.58%	10.66%	6/19/2006
After Taxes on Distributions	15.92%	28.57%	10.20%	—
After Taxes on Distributions and Sale of Shares	9.01%	23.86%	8.50%	—
S&P MidCap 400 <sup>#</sup>	9.77%	16.53%	10.02%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Russell2000 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Russell 2000® Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.34%
Acquired Fund Fees and Expenses*	0.01%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.10%</b>
Fee Waiver/Reimbursement**	-0.14%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.96%</b>
--	--------------

\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses

Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (excluding Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$98	\$336	\$593	\$1,328

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 179% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in equity securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a measure of small-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index containing approximately 2000 of the smallest companies in the Russell 3000® Index or approximately 8% of the total market capitalization of the Russell 3000® Index, which in turn represents approximately 98% of the investable U.S. equity

market As of June 30, 2015, the Index included companies with capitalizations between approximately \$102.5 million and \$4.7 billion. The average capitalization of the companies comprising the Index was approximately \$1.1 billion. The Index is published under the Bloomberg ticker symbol "RTY."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds ("ETFs")), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare

Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is

designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index

performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

#### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.16%. The Index's highest June to June volatility rate during the five-year period was 33.27% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.07%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and other Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely

payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural

disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be

dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2009): 40.26%

Worst Quarter (ended 12/31/2008): -53.88%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 8.13%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	6.04%	26.04%	3.71%	1/23/2007
After Taxes on Distributions	6.02%	26.03%	3.59%	—
After Taxes on Distributions and Sale of Shares	3.44%	21.63%	2.85%	—
Russell 2000® Index#	4.89%	15.54%	7.00%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra SmallCap600 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the S&P SmallCap 600® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.69%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.44%</b>
Fee Waiver/Reimbursement**	-0.49%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Acquired Fund Fees and Expenses” for the fiscal year end May 31, 2015 were less than 0.01% and are included in “Other Expenses”.

“Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies, such as business development companies and/or exchange traded funds. They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s NAV. They have no impact on the costs associated with Fund operations.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$407	\$740	\$1,682

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 17% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a measure of small-cap company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 600 U.S. operating companies selected through a process that factors in criteria such as liquidity, price, market capitalization, financial viability and public float. As of June 30, 2015, the Index included companies with capitalizations between approximately \$72.3 million and \$16.8 billion. The average capitalization of the companies comprising the Index was approximately \$1.3 billion. The Index is published under the Bloomberg ticker symbol “SML.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 20.30%. The Index's highest June to June volatility rate during the five-year period was 32.06% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 18.43%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible

to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2009): 40.72%

Worst Quarter (ended 12/31/2008): -51.63%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 6.89%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	7.81%	29.81%	7.17%	1/23/2007
After Taxes on Distributions	7.81%	29.81%	6.92%	—
After Taxes on Distributions and Sale of Shares	4.42%	24.96%	5.61%	—
S&P SmallCap 600®#	5.76%	17.26%	8.51%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro S&P500 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the S&P 500® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses:	0.20%
Recoupment	0.03%
Other Operating Expenses	0.17%
<b>Total Annual Fund Operating Expenses*</b>	<b>0.95%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$303	\$525	\$1,166

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 6% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index is a measure of large-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 500 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$3.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$39.3 billion. The Index is published under the Bloomberg ticker symbol “SPX.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the

Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired

exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Three times (3x) the One Year Index	10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.17%. The Index's highest June to June volatility rate during the five-year period was 23.54% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.33%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index,

and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible

to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 03/31/2012): 41.08%

Worst Quarter (ended 9/30/2011): -41.75%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 0.43%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	38.00%	39.60%	51.77%	6/23/2009
After Taxes on Distributions	37.93%	39.56%	51.73%	—
After Taxes on Distributions and Sale of Shares	21.57%	33.72%	45.28%	—
S&P 500®#	13.69%	15.45%	18.74%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro QQQ (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the NASDAQ-100 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.26%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.01%</b>
Fee Waiver/Reimbursement*	-0.06%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$316	\$552	\$1,231

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 9% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index, a modified market capitalization-weighted index, includes 100 of the largest non-financial domestic and international issues listed on The NASDAQ Stock Market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$5.6 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$55.3 billion. The Index is published under the Bloomberg ticker symbol “NDX.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for

investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s

portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that

event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Three times (3x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.67%. The Index's highest June to June volatility rate during the five-year period was 24.08% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 21.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on The NASDAQ Stock Market and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare

Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology industry to the same extent as the Index is so concentrated. Securities of information technology companies may be subject to greater volatility than stocks of companies in other market sectors. Like other technology companies, information technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Information technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the information technology industries as a whole. The information technology industry may also be affected by risks that affect the telecommunications industry, including a telecommunications market characterized by increasing competition and regulation by the Federal Communications Commission and various state regulatory authorities; the need

to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 03/31/2012): 75.86%

Worst Quarter (ended 9/30/2011): -28.28%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 9.30%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	56.82%	59.23%	2/9/2010
After Taxes on Distributions	56.81%	59.23%	—
After Taxes on Distributions and Sale of Shares	32.17%	51.60%	—
NASDAQ-100 Index#	19.40%	21.13%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as

a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Dow30 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Dow Jones Industrial Average<sup>SM</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.28%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.03%</b>
Fee Waiver/Reimbursement*	-0.08%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$320	\$561	\$1,252

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 24% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index is a price-weighted index and includes 30 large-cap, “blue-chip” U.S. stocks, excluding utility and transportation companies. Components are selected through a discretionary process with no predetermined criteria except that components should be established U.S. companies that are leaders in their industries, have an excellent reputation, demonstrate sustained growth, are of interest to a large number of investors and accurately represent the sectors covered by the average. The Index is not limited to traditionally defined industrial stocks; instead, the Index serves as a measure of the entire U.S. market, covering such diverse industries as financial services, technology, retail, entertainment and consumer goods. Composition changes are rare, and generally occur only after corporate acquisitions or other dramatic shifts in a component’s core business. When such an event necessitates the replacement of one component, the entire Index is reviewed. As of June 30, 2015, the Index included companies with

capitalizations between approximately \$30.8 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$180.7 billion. The Index is published under the Bloomberg ticker symbol “INDU.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or

financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due

to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities

included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Three times (3x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.97%. The Index's highest June to June volatility rate during the five-year period was 21.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 15.40%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by

the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment

results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2013): 38.45%

Worst Quarter (ended 9/30/2011): -35.69%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -3.42%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	25.71%	41.15%	2/9/2010
After Taxes on Distributions	25.56%	41.05%	—
After Taxes on Distributions and Sale of Shares	14.66%	35.04%	—
Dow Jones Industrial Average <sup>#</sup>	10.04%	15.34%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro MidCap400 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the S&P MidCap 400® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.41%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.16%</b>
Fee Waiver/Reimbursement**	-0.21%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Acquired Fund Fees and Expenses” for the fiscal year end May 31, 2015 were less than 0.01% and are included in “Other Expenses”.

“Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies, such as business development companies and/or exchange traded funds. They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s NAV. They have no impact on the costs associated with Fund operations.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$348	\$618	\$1,390

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 17% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index is a measure of mid-size company U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index of 400 U.S. operating companies and real estate investment trusts selected through a process that factors in criteria such as liquidity, price, market capitalization and financial viability. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$11.7 billion. The average capitalization of the companies comprising the Index was approximately \$4.2 billion. The Index is published under the Bloomberg ticker symbol “MID.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the

assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may

not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If

Fund expenses and/or actual borrowing/ lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Three times (3x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.10%. The Index's highest June to June volatility rate during the five-year period was 29.15% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.81%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term**

performance of the Fund, see “Principal Risks of Geared Funds and the Impact of Compounding” in the back of the Fund’s Full Prospectus and “Special Note Regarding the Correlation Risks of Geared Funds” in the Fund’s Statement of Additional Information.

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to

acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

- Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 03/31/2012): 43.76%

Worst Quarter (ended 9/30/2011): -55.15%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 9.57%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	22.97%	43.04%	2/9/2010
After Taxes on Distributions	22.95%	43.04%	—
After Taxes on Distributions and Sale of Shares	13.02%	36.78%	—
S&P MidCap 400 <sup>®</sup> #	9.77%	17.76%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily

leveraged investment results (i.e., 3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Russell2000 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Russell 2000® Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.49%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.24%</b>
Fee Waiver/Reimbursement**	-0.29%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Acquired Fund Fees and Expenses” for the fiscal period ended May 31, 2015 were less than 0.01% and are included in “Other Expenses”.

“Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies, such as business development companies or exchange-traded funds. They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s NAV. They have no impact on the costs associated with Fund operations.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to

reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (excluding Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$365	\$653	\$1,474

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 38% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index is a measure of small-cap U.S. stock market performance. It is a float-adjusted, market capitalization-weighted index containing approximately 2000 of the smallest companies in the Russell 3000® Index or approximately 8% of the total market capitalization of the Russell 3000® Index, which in turn represents approximately 98% of the investable U.S. equity market. As of June 30, 2015, the Index included companies with capitalizations between approximately \$102.5 million and \$4.7 billion. The average capitalization of the companies comprising the Index was approximately \$1.1 billion. The Index is published under the Bloomberg ticker symbol “RTY.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all

times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with

respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Three times (3x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.16%. The Index's highest June to June volatility rate during the five-year period was 33.27% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.07%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund

being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments, and/or may incur substantial trading losses.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings,

supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 03/31/2013): 39.73%

Worst Quarter (ended 9/30/2011): -59.42%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 10.97%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	5.60%	37.14%	2/9/2010
After Taxes on Distributions	5.60%	37.13%	—
After Taxes on Distributions and Sale of Shares	3.17%	31.44%	—
Russell 2000 Index <sup>#</sup>	4.89%	17.07%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be

held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Rachel Ames, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or

delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Basic Materials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Basic Materials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.34%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.09%</b>
Fee Waiver/Reimbursement*	-0.14%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$333	\$587	\$1,316

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 9% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the basic materials sector of the U.S. equity market. Component companies are involved in the production of aluminum, steel, non-ferrous metals, commodity chemicals, specialty chemicals, forest products, paper products, as well as the mining of precious metals and coal. As of June 30, 2015, the Index included companies with capitalizations between approximately \$608.3 million and \$59.0 billion. The average capitalization of the companies comprising the Index was approximately \$11.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSBM.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

#### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.50%. The Index's highest June to June volatility rate during the five-year period was 33.40% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 11.05%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result

in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s

holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 56.54%

Worst Quarter (ended 12/31/2008): -66.86%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -4.51%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
<b>Before Taxes</b>	2.82%	10.34%	-1.54%	1/30/2007
<b>After Taxes on Distributions</b>	2.72%	10.02%	-2.21%	—
<b>After Taxes on Distributions and Sale of Shares</b>	1.69%	8.16%	-1.07%	—
<b>Dow Jones U.S. Basic Materials<sup>SM</sup> Index<sup>#</sup></b>	3.39%	9.08%	6.19%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Nasdaq Biotechnology (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the NASDAQ Biotechnology Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.29%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**1.04%**

Fee Waiver/Reimbursement\*

-0.09%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$322	\$565	\$1,263

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 41% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a modified capitalization weighted index that includes securities of NASDAQ listed companies that are classified as either biotechnology or pharmaceutical according to the Industry Classification Benchmark (“ICB”) which also meet other eligibility criteria determined by NASDAQ, including minimum market capitalization and liquidity requirements. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.1 million and \$172.1 billion. The average capitalization of the companies comprising the Index was approximately \$7.1 billion. The Index is published under the Bloomberg ticker symbol “NBI.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the health care industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap

agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Health Care Industry Risk** – The Fund is subject to risks faced by companies in the healthcare economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; expenses and losses from extensive litigation based on product liability and similar claims; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting; the long and costly process for obtaining new product approval by the Food and Drug Administration; the difficulty healthcare providers may have obtaining staff to deliver service; susceptibility to product obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel.
- Biotechnology Industry Risk** – The Fund is subject to risks faced by companies in the biotechnology economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patents and intellectual property rights, with profitability affected by the loss or impairment of such rights; risks of new technologies and competitive pressures; large expenditures on research and development of products or services that may not prove commercially successful or may become obsolete quickly; regulations and restrictions imposed by the Food and Drug Administration, the Environmental Protection Agency, state and local governments, and foreign regulatory authorities; and thin capitalization and limited product lines, markets, financial resources or personnel. Moreover, stock prices of biotechnology companies are very volatile, particularly when their products are up for regulatory approval and/or under regulatory scrutiny. The biotechnology sector may also be affected by risks that affect the broader health care industry, including expenses and losses from extensive litigation on product liability and similar claims.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than

a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 22.33%. The Index's highest June to June volatility rate during the five-year period was 27.11% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 37.34%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure

consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors,

industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on The NASDAQ Stock Market and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2013): 44.07%

Worst Quarter (ended 9/30/2011): -26.43%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 43.80%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	66.69%	56.69%	4/7/2010
After Taxes on Distributions	66.69%	56.69%	—
After Taxes on Distributions and Sale of Shares	37.75%	49.10%	—
NASDAQ Biotechnology Index® #	34.40%	29.33%	—

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Consumer Goods (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Consumer Goods<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.80%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.55%</b>
Fee Waiver/Reimbursement*	-0.60%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$431	\$788	\$1,795

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 34% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of consumer spending in the goods sector of the U.S. equity market. Component companies include, among others, automobiles and auto parts and tires, brewers and distillers, farming and fishing, durable and non-durable household product manufacturers, cosmetic companies, food and tobacco products, clothing, accessories and footwear. As of June 30, 2015, the Index included companies with capitalizations between approximately \$986.6 million and \$212.3 billion. The average capitalization of the companies comprising the Index was approximately \$20.0 billion. The Index is published under the Bloomberg ticker symbol “DJUSNC.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** — The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer staples industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective.

This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 12.68%. The Index's highest June to June volatility rate during the five-year period was 17.89% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.37%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Consumer Staples Industry Risk** – The Fund is subject to risks faced by companies in the consumer staples economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, beverage and tobacco related products; and international events that may affect food, beverage and tobacco companies that derive a substantial portion of their net income from foreign countries.
- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or out-

side of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s

average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2009): 29.96%

Worst Quarter (ended 12/31/2008): -38.10%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 1.07%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	22.35%	31.43%	14.97%	1/30/2007
After Taxes on Distributions	22.17%	31.29%	14.70%	—
After Taxes on Distributions and Sale of Shares	12.77%	26.36%	12.34%	—
Dow Jones U.S. Consumer Goods <sup>SM</sup> Index <sup>#</sup>	12.11%	16.50%	10.03%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily

leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large

blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Consumer Services (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Consumer Services<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.65%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.40%</b>
Fee Waiver/Reimbursement*	-0.45%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$399	\$723	\$1,641

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 54% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of consumer spending in the services sector of the U.S. equity market. Component companies include, among others, airlines, broadcasting and entertainment, apparel and broadline retailers, food and drug retailers, media agencies, publishing, gambling, hotels, restaurants and bars, and travel and tourism. As of June 30, 2015, the Index included companies with capitalizations between approximately \$560.8 million and \$228.4 billion. The average capitalization of the companies comprising the Index was approximately \$19.5 billion. The Index is published under the Bloomberg ticker symbol “DJUSCY.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer discretionary industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.18%. The Index's highest June to June volatility rate during the five-year period was 22.24% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 23.52%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Consumer Discretionary Industry Risk** – The Fund is subject to risks faced by companies in the consumer discretionary industry to the same extent as the Index is so concentrated, including: the

fact that securities prices and profitability may be tied closely to the performance of the domestic and international economy, interest rates, competition and consumer confidence; heavy dependence on disposable household income and consumer spending; severe competition; and changes in demographics and consumer tastes, which can affect the success of consumer products.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to per-

form its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 37.45%

Worst Quarter (ended 12/31/2008): -42.69%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 7.97%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	26.88%	42.43%	14.27%	1/30/2007
After Taxes on Distributions	26.84%	42.39%	14.17%	—
After Taxes on Distributions and Sale of Shares	15.24%	36.29%	11.80%	—
Dow Jones U.S. Consumer Services <sup>SM</sup> Index <sup>#</sup>	14.53%	21.78%	10.72%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio

Manager, have jointly and primarily managed the Fund since October 2013.

### **Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at

NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### **Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Financials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Financials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.21%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**0.96%**

Fee Waiver/Reimbursement\*

-0.01%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by

ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$305	\$530	\$1,177

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 7% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the financial services sector of the U.S. equity market. Component companies include: among others, regional banks; major U.S. domiciled international banks; full line, life, and property and casualty insurance companies; companies that invest, directly or indirectly in real estate; diversified financial companies such as Fannie Mae, credit card issuers, check cashing companies, mortgage lenders and investment advisors; securities brokers and dealers including investment banks, merchant banks and online brokers; and publicly traded stock exchanges. As of June 30, 2015, the Index included companies with capitalizations between approximately \$619.9 million and \$336.0 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSFN.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the

Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 19.85%. The Index's highest June to June volatility rate during the five-year period was 32.78% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.88%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Regional Banking Industry Risk** – The Fund is subject to risks faced by companies in the banks economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects on profitability due to increases in interest rates or loan losses (which usually increase in economic downturns, which could lead to insolvency or other negative consequences); severe price competition; economic conditions; credit rating downgrades; and increased inter-industry consolidation and competition. This sector has experienced significant losses in the past, and the impact of more stringent capital requirements and of recent or future regulation on any individual bank or on the sector as a whole cannot be predicted.

Performance of small and mid-size regional banks may involve greater risk, more volatility and less liquidity than customarily is associated with investments in larger, more established banks. Regional bank securities may have returns that vary, sometimes significantly, from the overall securities market and/or the overall financial sector. The regional banking industry is highly competitive and failure to maintain or increase market share may result in the loss of market share and decline in market value. The banks sector may also be affected by risks that affect the broader financial services industry.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counter-

parties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 6/30/2009): 51.00%

Worst Quarter (ended 12/31/2008): -66.45%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.70%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	27.39%	22.07%	-17.02%	1/30/2007
After Taxes on Distributions	27.20%	21.97%	-17.17%	—
After Taxes on Distributions and Sale of Shares	15.63%	18.14%	-10.56%	—
Dow Jones U.S. Financials <sup>SM</sup> Index <sup>#</sup>	14.59%	13.89%	-1.17%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Gold Miners (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the NYSE Arca Gold Miners Index (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	3.65%
Acquired Fund Fees and Expenses**	0.17%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement***	4.57%
	-3.45%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**1.12%**

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years
\$114	\$1,068

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may

result in higher taxes when the Fund's shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund's performance. During the period from February 12, 2015 (the Fund's inception date) to May 31, 2015, the Fund's portfolio turnover rate was 18% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a modified market-capitalization weighted index primarily comprised of publicly traded companies involved in the mining of gold and silver. The weight of companies whose revenues are more significantly exposed to silver mining will not exceed 20% of the Index at the time of the Index's rebalance. As of June 30, 2015, the Index included 40 securities of companies with a market capitalization range of between approximately \$70.6 million and \$13.4 billion and an average market capitalization of \$2.9 billion. The Index is published under the Bloomberg ticker symbol "GDM."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Exchange-Traded Funds (ETFs)** – The Fund may invest in shares of other ETFs, which are registered investment companies that are traded on stock exchanges and hold assets such as stocks or bonds.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
- **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
- **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market

instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index.

ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group and in Canada.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested.

The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or

worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses.

Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent.

If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 34.80%. The Index's highest June to June volatility rate during the five-year period was 37.92% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was -18.26%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because certain of the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the Fund is exposed to risks associated with investments in Canada. The United States is Canada's largest trading and investment partner, and the Canadian economy is

significantly affected by developments in the U.S. economy. Any downturn in U.S. economic activity is likely to have an adverse impact on the Canadian economy. Among other things, the Canadian economy is heavily dependent on relationships with certain key trading partners, including the U.S., European Union countries and China. Canada is also susceptible to fluctuations in certain commodity markets. Any negative changes in commodity markets could have an adverse impact on the Canadian economy. As such, the Fund is subject to these risks to a much greater degree than funds that do not invest materially in Canadian issuers.

- **Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.
- **Gold and Silver Mining Industry Risk** – The Fund is subject to risks faced by the gold and silver mining industry, in particular risks related to changes in the price of gold and silver. In addition, changing inflation expectations, the availability of alternatives, such as synthetic substitutes, disruptions in the supply chain, rising production costs, including storage, labor and energy, rising regulatory compliance costs, increased environmental regulations and changes in industrial, government and global consumer demand may adversely affect companies engaged in gold and/or silver related businesses. Depending on market conditions, gold and silver mining companies may dramatically outperform or underperform more traditional equity investments.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Risk of Investing in Exchange-Traded Funds (ETFs)** – Investing in other investment companies, such as ETFs, subjects the Fund to those risks affecting the underlying ETFs, such as risks that the investment management strategy of the ETF may not produce its intended results (management risk) and the risk that the ETF could lose money over short periods due to short-term market movements and over longer periods during market downturns (market risk). In addition, investing in ETFs involves the risk that an ETF's performance may not track the performance of the index or markets that the ETF is designed to track, which may result in losses to such ETF and, ultimately, the Fund. Moreover, the Fund will incur its pro rata share of the expenses of the underlying ETF's expenses.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a correlation with the Index.
  - **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
  - **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
  - **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
  - **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.
  - **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
  - **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.
- Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.
- ### Investment Results
- Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since February 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares

on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Junior Miners (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Market Vectors Global Junior Gold Miners Index (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	3.48%
Acquired Fund Fees and Expenses**	0.19%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**4.42%**

Fee Waiver/Reimbursement\*\*\*

**-3.28%**

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**1.14%**

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (excluding Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/ expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Year
\$116	\$1,040

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may

result in higher taxes when the Fund's shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund's performance. During the period from February 12, 2015 (the Fund's inception date) to May 31, 2015, the Fund's portfolio turnover rate was 50% of the average value of its entire portfolio.

## Principal Investment Strategies

The Fund invests in derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index includes companies that generate at least 50% of their revenues from (or, in certain circumstances, have at least 50% of their assets related to) gold mining and/or silver mining or have mining projects with the potential to generate at least 50% of their revenues from gold and/or silver when developed. The weight of companies determined to be "silver" stocks will not exceed 20% of the Index at any quarterly rebalance. Between rebalances, however, the weight may exceed 20% due to market appreciation. Such companies may include micro- and small-capitalization companies and foreign issuers. As of June 30, 2015, the Index included 57 securities of companies with a market capitalization range of between approximately \$79.7 million and \$1.6 billion and an average market capitalization of \$537.4 million. The Index is published under the Bloomberg ticker symbol "MVGDXJ."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Exchange-Traded Funds (ETFs)** – The Fund may invest in shares of other ETFs, which are registered investment companies that are traded on stock exchanges and hold assets such as stocks or bonds.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.

- **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the materials industry group and in Canada.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses.

Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent.

If Fund expenses and/or actual borrowing/ lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index

volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 39.02%. The Index's highest June to June volatility rate during the five-year period was 43.73% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was -22.96%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities

may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete,

unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because certain of the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the Fund is exposed to risks associated with investments in Canada. The United States is Canada's largest trading and investment partner, and the Canadian economy is significantly affected by developments in the U.S. economy. Any downturn in U.S. economic activity is likely to have an adverse impact on the Canadian economy. Among other things, the Canadian economy is heavily dependent on relationships with certain key trading partners, including the U.S., European Union countries and China. Canada is also susceptible to fluctuations in certain commodity markets. Any negative changes in commodity markets could have an adverse impact on the Canadian economy. As such, the Fund is subject to these risks to a much greater degree than funds that do not invest materially in Canadian issuers.

- **Materials Industry Risk** – The Fund is subject to risks faced by companies in the materials sector to the same extent as the Index is so concentrated, including: adverse effects from commodity price volatility, exchange rates, import controls and increased competition; the possibility that production of industrial materials will exceed demand as a result of overbuilding or economic downturns, leading to poor investment returns; risk for environmental damage and product liability

claims; and adverse effects from depletion of resources, technical progress, labor relations and government regulations.

- **Gold and Silver Mining Industry Risk** – The Fund is subject to risks faced by the gold and silver mining industry, in particular risks related to changes in the price of gold and silver. In addition, changing inflation expectations, the availability of alternatives, such as synthetic substitutes, disruptions in the supply chain, rising production costs, including storage, labor and energy, rising regulatory compliance costs, increased environmental regulations and changes in industrial, government and global consumer demand may adversely affect companies engaged in gold and/or silver related businesses. Depending on market conditions, gold and silver mining companies may dramatically outperform or underperform more traditional equity investments.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Risk of Investing in Exchange-Traded Funds (ETFs)** – Investing in other investment companies, such as ETFs, subjects the Fund to those risks affecting the underlying ETFs, such as risks that the investment management strategy of the ETF may not produce its intended results (management risk) and the risk that the ETF could lose money over short periods due to short-term market movements and over longer periods during market downturns (market risk). In addition, investing in ETFs involves the risk that an ETF's performance may not track the performance of the index or markets that the ETF is designed to track, which may result in losses to such ETF and, ultimately, the Fund. Moreover, the Fund will incur its pro rata share of the expenses of the underlying ETF's expenses.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is

open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Micro-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and micro-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and micro-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and micro-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and micro-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and micro- cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and

micro- cap security prices. Micro-cap companies are subject to substantially greater risks of loss and price fluctuations. The shares of micro-cap companies tend to trade less frequently than those of larger, more established companies, which can adversely affect the pricing of these securities and the future ability to sell these securities.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since February 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Health Care (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Health Care<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.28%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.03%</b>
Fee Waiver/Reimbursement*	-0.08%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$320	\$561	\$1,252

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 22% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the healthcare sector of the U.S. equity market. Component companies include, among others, health care providers, biotechnology companies, medical supplies, advanced medical devices and pharmaceuticals. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.1 million and \$270.3 billion. The average capitalization of the companies comprising the Index was approximately \$29.2 billion. The Index is published under the Bloomberg ticker symbol “DJUSHC.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the health care industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses

all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 14.58%. The Index's highest June to June volatility rate during the five-year period was 19.69% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 24.49%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to

accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Health Care Industry Risk** – The Fund is subject to risks faced by companies in the healthcare economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; expenses and losses from extensive litigation based on product liability and similar claims; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting; the long and costly process for obtaining new product approval by the Food and Drug Administration; the difficulty healthcare providers may have obtaining staff to deliver service; susceptibility to product obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel.
- **Pharmaceuticals Industry Risk** – The Fund is subject to the risks faced by companies in the pharmaceuticals economic sector to the same extent as the Index is so concentrated, including: securities prices may fluctuate widely due to government regulation and approval of products and services, which can have a significant effect on their price and availability; heavy spending on research and development for products and services that may not prove commercially successful or may become obsolete quickly; liability for products that are later alleged to be harmful or unsafe may be substantial, which may have a significant impact on market value and/or securities prices; adverse effects from government regulation, world events and economic conditions; and market, economic and political risks of the countries where pharmaceutical companies are located or do business. The pharmaceuticals sector may also be affected by risks that affect the broader health care industry, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounts; and thin capitalization and limited product lines, markets and financial resources or personnel.

- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2013): 33.80%

Worst Quarter (ended 12/31/2008): -30.64%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 20.60%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	52.07%	38.37%	18.50%	1/30/2007
After Taxes on Distributions	51.98%	38.25%	18.21%	—
After Taxes on Distributions and Sale of Shares	29.52%	32.57%	15.45%	—
Dow Jones U.S. Health Care <sup>SM</sup> Index <sup>#</sup>	25.76%	19.98%	12.08%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Homebuilders & Supplies (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Select Home Construction Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.46%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.21%</b>
Fee Waiver/Reimbursement**	-0.26%

<b>Total Net Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be

terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$358

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the home construction sector of the U.S. equity market. The Index includes companies that are constructors of residential homes, including manufacturers of mobile and prefabricated homes, as well as producers, sellers and suppliers of building materials, furnishings and fixtures. The companies selected for inclusion in the Index must meet minimum market capitalization and liquidity requirements and have a majority of revenues sourced from residential home construction and remodel related business activities. The Index may include large-, mid- or small capitalization companies, and components primarily include consumer goods, consumer services, home construction and industrials companies.

As of June 30, 2015, the Index was comprised of 41 stocks. The companies included in the Index have an average market capitalization of \$9.1 billion and have capitalizations ranging from \$390.1 million to \$144.4 billion. The components of the Index, and the degree to which these components represent certain

industries, may change over time. The Index is published under the Bloomberg ticker symbol “DJSHMB.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without

regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be re-positioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer discretionary industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with

respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five year period ended June 30, 2015 was 27.84%. The Index's highest June to June volatility rate during the five year period was 39.91% (June 30, 2012). The Index's annualized total return performance for the five year period ended June 30, 2015 was 20.74%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the**

**Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Consumer Discretionary Industry Risk** – The Fund is subject to risks faced by companies in the consumer discretionary industry to the same extent as the Index is so concentrated, including: the fact that securities prices and profitability may be tied closely to the performance of the domestic and international economy, interest rates, competition and consumer confidence; heavy dependence on disposable household income and consumer spending; severe competition; and changes in demographics and consumer tastes, which can affect the success of consumer products.
- **Homebuilding Industry Risk** – The homebuilding industry, which includes home builders (including manufacturers of mobile and prefabricated homes), as well as producers, sellers and suppliers of building materials, furnishings and fixtures, may be significantly affected by changes in government spending, zoning laws, general economic conditions, interest rates, commodity prices, consumer confidence and spending, taxation, demographic patterns, real estate values, overbuilding, housing starts, and new and existing home sales. Rising interest rates, reductions in mortgage availability to consumers, increasing foreclosure rates or increases in the costs of owning a home could reduce the market for new homes and adversely affect the profitability of home construction companies. Certain segments of the homebuilding industry can be significantly affected by environmental clean-up costs and catastrophic events such as earthquakes, hurricanes and terrorist acts. Home construction companies may lack diversification, due to ownership of a limited number of properties and concentration in a particular geographic region or property type.
- **Industrials Sector Risk** – The value of securities issued by companies in the industrials sector may be adversely affected by supply and demand related to their specific products or services and industrials sector products in general. The products of manufacturing companies may face obsolescence due to rapid technological developments and frequent new product

introduction. Government regulations, world events, economic conditions and exchange rates may adversely affect the performance of companies in the industrials sector. Companies in the industrials sector may be adversely affected by liability for environmental damage and product liability claims.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Retail Industry Group Risk** – The Fund may invest in securities of companies in the retail industry group or companies that are closely tied to the retail industry group. Compared to other industries, retail and retail-related companies may be significantly affected by the performance of the domestic and international economy, consumer confidence and spending, intense competition, changes in demographics, interest rates, commodity prices, and changing consumer tastes and preferences. Companies such as home improvement retailers depend heavily on disposable household income, consumer spending, availability of credit for home construction and renovation, the overall health of the housing sector and the introduction of popular retail products. The success of new retail products may be strongly affected by social trends, marketing campaigns and other factors affecting supply and demand.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and

personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

### **Investment Results**

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

### **Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since June 2015.

### **Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell Fund shares on a national securities exchange through a broker-dealer. Because the Fund’s shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### **Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Industrials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Industrials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.57%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.32%</b>
Fee Waiver/Reimbursement*	-0.37%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$382	\$688	\$1,558

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 23% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the industrial sector of the U.S. equity market. Component companies include, among others, building materials, heavy construction, factory equipment, heavy machinery, industrial services, pollution control, containers and packaging, industrial diversified, air freight, marine transportation, railroads, trucking, land-transportation equipment, shipbuilding, transportation services, advanced industrial equipment, electric components and equipment, and aerospace. As of June 30, 2015, the Index included companies with capitalizations between approximately \$261.9 million and \$267.7 billion. The average capitalization of the companies comprising the Index was approximately \$12.7 billion. The Index is published under the Bloomberg ticker symbol “DJUSIN.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the industrials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective.

This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 17.90%. The Index's highest June to June volatility rate during the five-year period was 27.60% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 17.79%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Industrial Industry Risk** – The Fund is subject to risks faced by companies in the industrial economic sector to the same extent as the Index is so concentrated, including: effects on stock prices by supply and demand both for their specific product or service and for industrial sector products in general; decline in demand for products due to rapid technological developments and frequent new product introduction; effects on securities prices and profitability from government regulation, world events and economic conditions; and risks for environmental damage and product liability claims.
- **Capital Goods Industry Risk** – The Fund is subject to risks faced by companies in the capital goods industry to the same extent as the Index is so concentrated, including: fluctuations in the business cycle, heavy dependence on corporate spending and by other factors affecting manufacturing demands. The capital goods industry may perform well during times of economic expansion, and as economic conditions worsen, the demand for capital goods may decrease due to weakening demand, worsening business cash flows, tighter credit controls and deteriorating profitability. During times of economic volatility, corporate spending may fall and adversely affect the capital goods industry. This capital goods industry may also be affected by changes in interest rates, corporate tax rates and other government policies. Many capital goods are sold internationally and such companies are subject to market conditions in other countries and regions.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond

quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.

- Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may

cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 44.74%

Worst Quarter (ended 12/31/2008): -49.89%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -2.29%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	11.03%	30.35%	7.82%	1/30/2007
After Taxes on Distributions	10.93%	30.28%	7.47%	—
After Taxes on Distributions and Sale of Shares	6.32%	25.42%	6.12%	—
Dow Jones U.S. Industrials <sup>SM</sup> Index <sup>#</sup>	7.30%	17.32%	8.49%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax

returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Oil & Gas (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Oil & Gas<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.31%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.06%</b>
Fee Waiver/Reimbursement*	-0.11%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$326	\$574	\$1,284

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 15% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the oil and gas sector of the U.S. equity market. Component companies include, among others, exploration and production, integrated oil and gas, oil equipment and services, pipelines, renewable energy equipment companies and alternative fuel producers. As of June 30, 2015, the Index included companies with capitalizations between approximately \$248.4 million and \$347.9 billion. The average capitalization of the companies comprising the Index was approximately \$17.9 billion. The Index is published under the Bloomberg ticker symbol “DJUSEN.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds

(including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the energy industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion

of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 20.88%. The Index's highest June to June volatility rate during the five-year period was 30.24% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 10.43%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Energy Industry Risk** – The Fund is subject to risks faced by companies in the energy sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where energy companies are located or do business; and risk for environmental damage claims. The energy industry has recently experienced significant volatility due to dramatic changes in the prices of energy commodities, and it is possible that such volatility will continue in the future.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities

would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides

some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2010): 45.00%

Worst Quarter (ended 12/31/2008): -53.55%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -10.24%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-21.96%	9.86%	-1.30%	1/30/2007
After Taxes on Distributions	-22.08%	9.76%	-1.88%	—
After Taxes on Distributions and Sale of Shares	-12.28%	7.83%	-0.95%	—
Dow Jones U.S. Oil & Gas <sup>SM</sup> Index <sup>#</sup>	-9.27%	8.35%	5.61%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares

on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Oil & Gas Exploration & Production (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the S&P Oil & Gas Exploration & Production Select Industry Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.46%
<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.21%</b>
Fee Waiver/Reimbursement**	-0.26%
<b>Total Net Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\*ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be

terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$358

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is equally weighted (as adjusted for diversification and liquidity) and includes domestic companies from the oil and gas exploration and production sub-industry.

As of June 30, 2015, the Index was comprised of 72 stocks. The companies included in the Index have an average market capitalization of \$16.7 billion. Component securities have capitalizations ranging from \$248 million to \$347 billion as of June 30, 2015. The components of the Index, and the degree to which these components represent certain industries, may change over time. The Index is published under the Bloomberg ticker symbol “SPSIOP.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be re-positioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the energy industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion

of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five year period ended June 30, 2015 was 31.23%. The Index's highest May to May volatility rate during the five year period was 44.35% (June 2012). The Index's annualized total return performance for the five year period ended June 30, 2015 was 4.82%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in

the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Energy Industry Risk** – The Fund is subject to risks faced by companies in the energy sector to the same extent as the Index is so concentrated, including: effects on profitability from changes in worldwide energy prices and exploration, and production spending; adverse effects from changes in exchange rates, government regulation, world events and economic conditions; market, economic and political risks of the countries where energy companies are located or do business; and risk for environmental damage claims. The Energy Industry has recently experienced significant volatility due to dramatic changes in the prices of energy commodities, and it is possible that such volatility will continue in the future.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund’s performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund’s ability to obtain exposure to those foreign investments at appropriate times.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies.

Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since June 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell Fund shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

---

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Real Estate (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Real Estate<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.25%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**1.00%**

Fee Waiver/Reimbursement\*

-0.05%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$313	\$548	\$1,220

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 14% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the real estate sector of the U.S. equity market. Component companies include, among others, real estate holding and development and real estate services companies and real estate investment trusts (“REITs”). REITs are passive investment vehicles that invest primarily in income producing real estate or real estate related loans or interests. As of June 30, 2015, the Index included companies with capitalizations between approximately \$990.2 million and \$53.9 billion. The average capitalization of the companies comprising the Index was approximately \$7.2 billion. The Index is published under the Bloomberg ticker symbol “DJUSRE.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** — The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective.

This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.37%. The Index's highest June to June volatility rate during the five-year period was 28.40% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 13.41%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities or financial instruments not included in the Index. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare

Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Real Estate Investment Trusts Industry Risk** – The Fund is subject to risks faced by companies in the real estate investment trusts industry to the same extent as the Index is so concentrated. Like the broader real estate industry, REITS may be affected by adverse changes in national, state or local real estate conditions (such as over-supply of or reduced demand for space

and changes in market rental rates); obsolescence of properties; changes in the availability, cost and terms of mortgage funds; and the impact of environmental laws. Further, REITs are dependent upon specialized management skills, and their investments may be concentrated in relatively few properties, or in a small geographic area or a single property type. REITs are also subject to heavy cash flow dependency and, as a result, are particularly reliant on the proper functioning of capital markets. REITs may also be affected by the failure to comply with the federal tax requirements affecting REITs which could subject a REIT to federal income taxation; and the risk that the federal tax requirement that a REIT distribute substantially all of its net income to its shareholders could result in a REIT having insufficient capital for future expenditures.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 68.60%

Worst Quarter (ended 12/31/2008): -75.93%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -11.96%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	57.64%	26.51%	-12.29%	1/30/2007
After Taxes on Distributions	56.67%	25.97%	-12.78%	—
After Taxes on Distributions and Sale of Shares	32.55%	21.70%	-8.32%	—
Dow Jones U.S. Real Estate <sup>SM</sup> Index <sup>#</sup>	27.24%	15.69%	2.71%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra S&P Regional Banking (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the S&P Regional Banks Select Industry Index (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.68%
<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.43%</b>
Fee Waiver/Reimbursement*	-1.48%
<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or

reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$616	\$1,161	\$2,653

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 77% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The S&P Regional Banks Select Industry Index is an equal-weighted index that seeks to provide diverse regional banking exposure. The Index includes stocks of 50 publicly traded companies that do business as regional banks or thrifts. Component companies include, among others, leading regional banks or thrifts listed on a U.S. exchange. As of June 30, 2015, the Index included companies with capitalizations between approximately \$349.9 million and \$49.5 billion. The average capitalization of the companies comprising the Index was approximately \$4.4 billion. The Index is published under the Bloomberg ticker symbol “SPSIRBK.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** — The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its

investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 24.13%. The Index's highest June to June volatility rate during the five-year period was 38.54% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.86%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree

of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate,

political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
  - **Regional Banking Industry Risk** – The Fund is subject to risks faced by companies in the banks economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects on profitability due to increases in interest rates or loan losses (which usually increase in economic downturns, which could lead to insolvency or other negative consequences); severe price competition; economic conditions; credit rating downgrades; and increased inter-industry consolidation and competition. This sector has experienced significant losses in the past, and the impact of more stringent capital requirements and of recent or future regulation on any individual bank or on the sector as a whole cannot be predicted.
- Performance of small and mid-size regional banks may involve greater risk, more volatility and less liquidity than customarily is associated with investments in larger, more established banks. Regional bank securities may have returns that vary, sometimes significantly, from the overall securities market and/or the overall financial sector. The regional banking industry is highly competitive and failure to maintain or increase market share may result in the loss of market share and decline in market value. The banks sector may also be affected by risks that affect the broader financial services industry.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
  - **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies.

Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day

investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2011): 53.28%

Worst Quarter (ended 9/30/2011): -45.91%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 18.08%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	0.10%	10.35%	4/20/2010
After Taxes on Distributions	0.02%	10.23%	—
After Taxes on Distributions and Sale of Shares	0.12%	8.19%	—
KBW Nasdaq Regional Banking Index*	2.42%	9.51%	—
S&P Regional Banks Select Industry Index <sup>SM#</sup>	2.35%	9.06%	—

\* On April 16, 2015, the Fund's underlying index changed from the KBW Regional Banking Index to the S&P Regional Banks Select Industry Index. This change was made in order to match the Fund's underlying index to its Investment Objective. As of June 2015, the name of the KBW Regional Banking Index was changed to the KBW Nasdaq Regional Banking Index.

# Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Semiconductors (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Semiconductors<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.51%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.26%</b>
Fee Waiver/Reimbursement*	-0.31%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$369	\$662	\$1,495

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 50% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the semiconductor sub-sector of the U.S. equity market. Component companies are engaged in the production of semiconductors and other integrated chips, as well as other related products such as semiconductor capital equipment and mother-boards. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.3 billion and \$144.3 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSSC.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective.

This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 21.57%. The Index's highest June to June volatility rate during the five-year period was 28.81% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 16.23%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes

that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology sector to the same extent as the Index is so concentrated. Securities of technology companies may be subject to greater volatility than stocks of companies in other market sectors. Technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the technology industries as a whole. The information technology sector is also affected by risks that affect the narrower semiconductors sector, including: relying on the economic performance of the customers of semiconductor companies and their research costs; and risks that their products may not prove commercially successful.

- **Semiconductors Industry Risk** – The Fund is subject to risks faced by companies in the semiconductor industry to the same extent as the Index is so concentrated, including: intense competition, both domestically and internationally, including competition from subsidized foreign competitors with lower production costs; wide fluctuations in securities prices due to risks of rapid obsolescence of products; economic performance of the customers of semiconductor companies, their research costs and the risks that their products may not prove commercially successful; capital equipment expenditures that could be substantial and suffer from rapid obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel. The semiconductors sector may also be affected by risks that affect the broader technology industry, including: government regulation; dramatic and often unpredictable changes in growth rates and competition for qualified personnel; heavy dependence on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability; and a small number of companies representing a large portion of the technology industry as a whole.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2009): 45.02%

Worst Quarter (ended 12/31/2008): -52.84%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -9.98%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	78.01%	23.76%	5.20%	1/30/2007
After Taxes on Distributions	77.59%	23.62%	4.83%	—
After Taxes on Distributions and Sale of Shares	44.44%	19.59%	3.96%	—
Dow Jones U.S. Semiconductors <sup>SM</sup> Index <sup>#</sup>	36.88%	15.18%	8.27%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors

who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Technology (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Technology<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.29%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.04%</b>
Fee Waiver/Reimbursement*	-0.09%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$322	\$565	\$1,263

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 14% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the technology sector of the U.S. equity market. Component companies include, among others, those involved in computers and office equipment, software, communications technology, semiconductors, diversified technology services and Internet services. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.3 billion and \$722.6 billion. The average capitalization of the companies comprising the Index was approximately \$30.0 billion. The Index is published under the Bloomberg ticker symbol “DJJUSTC.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** — The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the information technology industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired

exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 17.25%. The Index's highest June to June volatility rate during the five-year period was 24.59% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 16.58%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare

Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Information Technology Industry Risk** – The Fund is subject to risks faced by companies in the information technology sector to the same extent as the Index is so concentrated. Securities of technology companies may be subject to greater volatility than stocks of companies in other market sectors. Technology companies may be affected by intense competition, obsolescence of existing technology, general economic conditions and government regulation and may have limited product lines, markets, financial resources or personnel. Technology companies may experience dramatic and often unpredictable changes in growth rates and competition for qualified personnel. These companies also are heavily dependent on patent and intellectual property rights, the loss or impairment of which may adversely affect profitability. A small number of companies represent a large portion of the technology industries as a whole. The information technology sector is also affected by risks that affect the narrower semiconductors sector, including: relying on the economic performance of the customers of semiconductor companies and their research costs; and risks that their products may not prove commercially successful.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 48.03%

Worst Quarter (ended 12/31/2008): -49.79%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.29%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	38.86%	23.67%	10.85%	1/30/2007
After Taxes on Distributions	38.78%	23.65%	10.69%	—
After Taxes on Distributions and Sale of Shares	22.06%	19.55%	8.78%	—
Dow Jones U.S. Technology <sup>SM</sup> Index <sup>#</sup>	20.04%	14.00%	9.59%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements,

such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Telecommunications (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Select Telecommunications<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	2.03%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.78%</b>
Fee Waiver/Reimbursement*	-1.83%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period

to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$688	\$1,306	\$2,975

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 158% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a measure of U.S. stock market performance of fixed line (regional and long-distance carriers) and mobile telephone services (cellular, satellite and paging services). As of June 30, 2015, the Index included companies with capitalizations between approximately \$643.3 million and \$190.1 billion. The average capitalization of the companies comprising the Index was approximately \$48.4 billion. The Index is published under the Bloomberg ticker symbol “DJSTEL.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an

underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely,

if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the telecommunication services industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion

of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/ lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.36%. The Index's highest June to June volatility rate during the five-year period was 22.94% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 12.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation

may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund.

Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Tax Risk** – In order to qualify as a regulated investment company for federal income tax purposes, the Fund must meet certain requirements regarding, among other things, the diversification of its assets. Given the limited number of securities in its index, the Fund has an increased risk of failing such diversification requirements. As a result of such requirements, the Fund’s ability to pursue its investment strategy may be limited by the Fund’s intention to qualify as a regulated investment company and its strategy could bear adversely on the Fund’s ability to so qualify. If in any year the Fund were to fail to qualify as a regulated investment company, it would be taxed in the same manner as an ordinary corporation subject to U.S. federal income tax on all its income at the Fund level. The resulting taxes could substantially reduce the Fund’s net assets and the amount of income available for distribution.
- Telecommunications Services Industry Risk** – The Fund is subject to risks faced by companies in the telecommunications services sector to the same extent as the Index is so concentrated, including: a telecommunications market characterized by increasing competition and regulation by the Federal Communications Commission and various state regulatory authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new

products and services using new technology; and technological innovations that may make various products and services obsolete. The telecommunications services industry is also affected by risks that affect the narrower mobile telecommunications sector, including: dramatic securities price fluctuations; recent industry consolidation trends that may lead to increased regulation in primary markets; and thin capitalization and limited product lines, markets financial resources or personnel.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2010): 36.19%

Worst Quarter (ended 9/30/2011): -34.18%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 1.25%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-2.25%	18.43%	5.05%	3/25/2008
After Taxes on Distributions	-2.42%	18.25%	4.70%	—
After Taxes on Distributions and Sale of Shares	-1.12%	15.00%	3.85%	—
Dow Jones U.S. Select Telecommunications <sup>SM</sup> Index <sup>#</sup>	0.53%	11.34%	6.72%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Utilities (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Dow Jones U.S. Utilities<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.58%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.33%</b>
Fee Waiver/Reimbursement*	-0.38%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$384	\$692	\$1,568

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 7% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index measures the performance of the utilities sector of the U.S. equity market. Component companies include, among others, electric utilities, gas utilities, multi-utilities and water utilities. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.4 billion and \$48.8 billion. The average capitalization of the companies comprising the Index was approximately \$10.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSUT.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or

indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:

- **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the utilities industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.

- **Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- **Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

### Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 13.56%. The Index's highest June to June volatility rate during the five-year period was 16.66% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 12.87%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the index or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare

Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Utilities Industry Risk** – The Fund is subject to risks faced by companies in the utilities sector to the same extent as the Index is so concentrated, including: review and limitation of rates by governmental regulatory commissions; the fact that the value of regulated utility instruments tends to have an inverse relationship to the movement of interest rates; the risk that utilities may engage in riskier ventures where they have little or no experience, as deregulation allows utilities to diversify outside of their original geographic regions and their traditional lines of business and greater competition as a result of deregulation, which may adversely affect profitability due to lower operating margins, higher costs and diversification into unprofitable business lines.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a

broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2013): 27.93%

Worst Quarter (ended 9/30/2008): -36.31%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -21.95%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	58.61%	25.29%	8.65%	1/30/2007
After Taxes on Distributions	57.86%	24.78%	7.94%	—
After Taxes on Distributions and Sale of Shares	33.63%	20.83%	6.71%	—
Dow Jones U.S. Utilities <sup>SM</sup> Index <sup>#</sup>	28.09%	14.03%	7.64%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares

on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Nasdaq Biotechnology (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the NASDAQ Biotechnology Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses*	0.48%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.23%</b>
Fee Waiver/Reimbursement**	-0.28%

<b>Total Net Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* “Other Expenses” are based on estimated amounts for the current fiscal year.

\*\*ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be

terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual costs may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>
\$97	\$363

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. The Fund commenced operations after the end of its most recent fiscal year. Thus, no portfolio turnover information is provided for this Fund.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index is a modified capitalization weighted index that includes securities of NASDAQ listed companies that are classified as either biotechnology or pharmaceutical according to the Industry Classification Benchmark (“ICB”) which also meet other eligibility criteria determined by NASDAQ, including minimum market capitalization and liquidity requirements. As of June 30, 2015, the Index included companies with capitalizations between approximately \$30.1 million and \$172.1 billion. The average capitalization of the companies comprising the Index was approximately \$7.1 billion. The Index is published under the Bloomberg ticker symbol “NBI.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** — The Fund invests in common stock issued by public companies.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds “ETFs”), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be re-positioned. For example, if the Index has

risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the health care industry group.

The Fund will not directly short the securities of issuers contained in the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired

exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Health Care Industry Risk** – The Fund is subject to risks faced by companies in the healthcare economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patent protection, with profitability affected by the expiration of patents; expenses and losses from extensive litigation based on product liability and similar claims; competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting; the long and costly process for obtaining new product approval by the Food and Drug Administration; the difficulty healthcare providers may have obtaining staff to deliver service; susceptibility to product obsolescence; and thin capitalization and limited product lines, markets, financial resources or personnel.
- Biotechnology Industry Risk** – The Fund is subject to risks faced by companies in the biotechnology economic sector to the same extent as the Index is so concentrated, including: heavy dependence on patents and intellectual property rights, with profitability affected by the loss or impairment of such rights; risks of new technologies and competitive pressures; large expenditures on research and development of products or services that may not prove commercially successful or may become obsolete quickly; regulations and restrictions imposed by the Food and Drug Administration, the Environmental Protection Agency, state and local governments, and foreign regulatory authorities; and thin capitalization and limited product lines, markets, financial resources or personnel. Moreover, stock prices of biotechnology companies are very volatile, particularly when their products are up for regulatory approval and/or under regulatory scrutiny. The biotechnology sector may also be affected by risks that affect the broader health care industry, including expenses and losses from extensive litigation on product liability and similar claims.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than

a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Three times (3x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five year period ended June 30, 2015 was 22.33%. The Index's highest June to June volatility rate during the five year period was 27.11% (June 29, 2012). The Index's annualized total return performance for the five year period ended June 30, 2015 was 37.34%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future. The volatility of U.S. exchange-traded securities or instruments that reflect the value of the Index may differ from the volatility of the Index.

For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking

positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures, and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's

next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on The NASDAQ Stock Market and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Small- and Mid-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of small- and mid-cap companies. The risk of equity investing may be particularly acute for securities of issuers with smaller market capitalizations. Small- and mid-cap company stocks may trade at greater spreads or lower trading volumes, and may be less liquid than the stocks of larger companies. Small- and mid-cap companies may have limited product lines or resources, may be dependent upon a particular market niche and may have greater fluctuations in price than the stocks of larger companies. Further, stocks of small- and mid-sized companies could be more difficult to liquidate during market downturns compared to larger, more widely traded companies. In addition, small- and mid-cap companies may lack the financial and personnel resources to handle economic or industry-wide setbacks and, as a result, such setbacks could have a greater effect on small- and mid-cap security prices.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

Performance history will be available for the Fund after it has been in operation for a full calendar year. After the Fund has a full calendar year of performance information, performance information will be shown on an annual basis.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since June 2015.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically, broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell Fund shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares UltraPro Financials (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Dow Jones U.S. Financials<sup>SM</sup> Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to three times (3x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.26%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>2.01%</b>
Fee Waiver/Reimbursement*	-1.06%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$528	\$985	\$2,252

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 18% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as three times (3x) the daily return of the Index. The Index measures the performance of the financial services sector of the U.S. equity market. Component companies include: among others, regional banks; major U.S. domiciled international banks; full line, life, and property and casualty insurance companies; companies that invest, directly or indirectly in real estate; diversified financial companies such as Fannie Mae, credit card issuers, check cashing companies, mortgage lenders and investment advisors; securities brokers and dealers including investment banks, merchant banks and online brokers; and publicly traded stock exchanges. As of June 30, 2015, the Index included companies with capitalizations between approximately \$619.9 million and \$336.0 billion. The average capitalization of the companies comprising the Index was approximately \$15.4 billion. The Index is published under the Bloomberg ticker symbol “DJUSFN.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of three times (3x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from three times (3x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the

Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of three times (3x) the Index, a single day movement in the Index approaching 33% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from three times (3x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than three times (3x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Three times (3x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-180%	-93.8%	-94.7%	-97.0%	-98.8%	-99.7%
-50%	-150%	-87.9%	-89.6%	-94.1%	-97.7%	-99.4%
-40%	-120%	-79.0%	-82.1%	-89.8%	-96.0%	-98.9%
-30%	-90%	-66.7%	-71.6%	-83.8%	-93.7%	-98.3%
-20%	-60%	-50.3%	-57.6%	-75.8%	-90.5%	-97.5%
-10%	-30%	-29.3%	-39.6%	-65.6%	-86.5%	-96.4%
0%	0%	-3.0%	-17.1%	-52.8%	-81.5%	-95.0%
10%	30%	29.2%	10.3%	-37.1%	-75.4%	-93.4%
20%	60%	67.7%	43.3%	-18.4%	-68.0%	-91.4%
30%	90%	113.2%	82.1%	3.8%	-59.4%	-89.1%
40%	120%	166.3%	127.5%	29.6%	-49.2%	-86.3%
50%	150%	227.5%	179.8%	59.4%	-37.6%	-83.2%
60%	180%	297.5%	239.6%	93.5%	-24.2%	-79.6%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -60% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -75.8% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 19.85%. The Index's highest June to June volatility rate during the five-year period was 32.78% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 14.88%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from three times (3x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 3x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may

be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to three times (3x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Large-Cap Company Investment Risk** – The Index and, by extension, the Fund are exposed to stocks of large-cap companies. Although returns on investments in large-cap companies are often perceived as being less volatile than the returns of companies with smaller market capitalizations, the return on large-cap securities could trail the returns on investments in smaller and mid-sized companies for a number of reasons. For example, large-cap companies may be unable to respond quickly to new competitive challenges, such as changes in technology, and also may not be able to attain the high growth rate of successful smaller companies.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural

disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows the Fund’s investment results for the Fund’s first full calendar year of operations, and the table shows

how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31

Best Quarter (ended 3/31/2013): 38.73%

Worst Quarter (ended 9/30/2014): 2.07%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -2.28%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	40.49%	81.90%	7/10/2012
After Taxes on Distributions	40.34%	81.78%	—
After Taxes on Distributions and Sale of Shares	23.01%	67.54%	—
Dow Jones U.S. Financials Index <sup>#</sup>	14.59%	25.17%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 3x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Michael Neches, Senior Portfolio Manager, and Charles Lowery, Portfolio Manager, have jointly and primarily managed the Fund since October 2013.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares

on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be significantly higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MSCI EAFE (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the MSCI EAFE Index<sup>®</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (11:30 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.48%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

1.23%

-0.28%

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$363	\$649	\$1,464

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index includes 85% of free float-adjusted, market capitalization in each industry group in developed market countries, excluding the U.S. and Canada. As of June 30, 2015, the Index consisted of the following 21 developed market country indexes: Australia, Austria, Belgium, Denmark, Finland, France, Germany, Hong Kong, Ireland, Israel, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland, and the United Kingdom. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.0 billion and \$232.9 billion. The average capitalization of the companies comprising the Index was approximately \$14.3 billion. The Index is published under the Bloomberg ticker symbol "MXEA."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:

- **American Depositary Receipts (ADRs)**, which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
- **Global Depositary Receipts (GDRs)**, which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in Developed Europe and Developed Asia.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.72%. The Index's highest June to June volatility rate during the five-year period was 23.46% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 9.53%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility

in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected

by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks.

In particular, the European markets have experienced significant volatility over recent years and several European Union member countries have been adversely affected by unemployment, budget deficits and economic downturns, which have caused those countries to experience credit rating downgrades and rising government debt levels. These events, or even the threat of these events, may cause the value of stocks issued by companies in European countries to fall (in some cases drastically) and may cause the value of debt issued by companies in European Countries to fall (in some cases drastically) and may cause further volatility in the European financial markets, either of which may negatively impact the Fund's returns.

In addition, the Fund is exposed to risks associated with investments in Asia, including, but not limited to: i) political, economic, or social instability in the region, ii) heightened risk of nationalization of companies or other forms of government interference; iii) exposure to less liquid and more volatile securities markets; iv) natural disasters more likely to occur in particular Asian countries; v) heightened exposure to foreign currency risks; and vi) long running border disputes and other conflicts among Asian countries.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the

applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time,

and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

- Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2010): 36.87%

Worst Quarter (ended 9/30/2011): -39.86%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 10.53%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-15.19%	4.14%	8.70%	6/2/2009
After Taxes on Distributions	-15.19%	4.13%	8.69%	—
After Taxes on Distributions and Sale of Shares	-8.60%	3.21%	6.91%	—
MSCI EAFE Index <sup>#</sup>	-4.90%	5.33%	7.82%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MSCI Emerging Markets (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the MSCI Emerging Markets Index® (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.45%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

1.20%

-0.25%

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$356	\$636	\$1,432

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily

return characteristics as two times (2x) the daily return of the Index. The Index includes 85% of free float-adjusted market capitalization in each industry group in emerging market countries. As of June 30, 2015, the Index consisted of the following 23 emerging market country indexes: Brazil, Chile, China, Colombia, Czech Republic, Egypt, Greece, Hungary, India, Indonesia, Korea, Malaysia, Mexico, Peru, Philippines, Poland, Qatar, Russia, South Africa, Taiwan, Thailand, Turkey and United Arab Emirates. As of June 30, 2015, the Index included companies with capitalizations between approximately \$97.8 million and \$125.6 billion. The average capitalization of the companies comprising the Index was approximately \$4.8 billion. The Index is published under the Bloomberg ticker symbol "MXEF."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.
- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
  - American Depositary Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.

- Global Depositary Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in Developed Asia.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or

worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For

example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 15.16%. The Index's highest June to June volatility rate during the five-year period was 22.75% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 3.68%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction

costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent

or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.

- **Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular, the Fund is exposed to risks associated with investments in Asia, including, but not limited to: i) political, economic, or social instability in the region, ii) heightened risk of nationalization of companies or other forms of government interference; iii) exposure to less liquid and more volatile securities markets; iv) natural disasters more likely to occur in particular Asian countries; v) heightened exposure to foreign currency risks; and vi) long running border disputes and other conflicts among Asian countries.

Recent events in the Russian Federation may have an adverse impact on the Fund. In response to related political and military actions by Russia, the United States and the European Union have instituted numerous sanctions against certain Russian officials and Bank Rossiya. These sanctions, and other intergovernmental actions that may be undertaken against Russia in the future, may cause a decline in the value and liquidity of securities offered by Russian issuers. Future sanctions could, among other actions, directly target transactions in Russian securities, impairing the ability of the Fund to buy, sell, receive, deliver, or obtain exposure to, those securities. Such events could have an adverse impact on the economies and securities issued in other emerging market countries as well. Because the Fund has exposure to investments in Russia and other emerging market countries, these events could have a negative effect on the performance of the Fund, and could interfere with the ability of the Fund to track its Index.

In addition, the Fund is exposed to risks associated with investments in Latin America, including, but not limited to: i) political, economic, or social instability in certain Latin American countries; ii) a heightened risk of high inflation and government deficits in certain Latin American countries; iii) natural disasters particularly likely to happen in Latin America; iv) heightened risk of currency devaluations; v) risks associated with Latin American economies' significant dependence on the health of the U.S. economy; and vi) risks associated with Latin American economies' sensitivity to fluctuations in the price of commodities such as oil and gas, minerals and metals (resulting from those economies' heavy reliance on the export of such commodities).

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting [ProShares.com](http://ProShares.com).

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2010): 40.26%

Worst Quarter (ended 9/30/2011): -48.64%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 1.08%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-11.07%	-5.02%	2.18%	6/2/2009
After Taxes on Distributions	-11.07%	-5.02%	2.18%	—
After Taxes on Distributions and Sale of Shares	-6.27%	-3.72%	1.69%	—
MSCI Emerging Markets Index <sup>®#</sup>	-2.19%	1.78%	5.86%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax

returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra FTSE Europe (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the FTSE Developed Europe Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (4:30 p.m., London Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.50%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

	<b>1.25%</b>
	<b>-0.30%</b>

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$367	\$657	\$1,485

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a free float-adjusted market cap weighted index comprised of large- and mid-cap European stocks, screened for liquidity. As of June 30, 2015, the Index consists of the following 16 developed market countries: Austria, Belgium/Luxembourg, Denmark, Finland, France, Germany, Greece, Ireland, Italy, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.7 billion and \$260.7 billion. The average capitalization of the companies comprising the Index was approximately \$20.9 billion. The Index is published under the Bloomberg ticker symbol “FTADo6.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
  - **American Depositary Receipts (ADRs)**, which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - **Global Depositary Receipts (GDRs)**, which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the United Kingdom and in Europe.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/ lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 17.46%. The Index's highest June to June volatility rate during the five-year period was 17.31% (June 28, 2013). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 10.02%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Consumer Goods Industry Risk** – The Fund is subject to risks faced by companies in the consumer goods economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or

financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to European Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Europe. Many countries included in the Index are members of the European Union (the “EU”) and all European countries may be significantly affected by EU policies and may be highly dependent on the economies of their fellow members. The European financial markets have experienced significant volatility over recent years and several European countries have been adversely affected by unemployment, budget deficits and economic downturns. In addition, several European countries have experienced credit rating downgrades, rising government debt levels and, for certain European countries (including Greece, Spain, Portugal, Ireland and Italy), weaknesses in sovereign debt. These events, along with decreasing imports or exports, changes in governmental or EU regulations on trade, the default or threat of default by a European country on its sovereign debt and/or an economic recession in a European country may have a significant adverse effect on the affected European country, issuers in the affected European country, the economies of other European countries, their trading partners or other European countries. Such events, or even the threat of such events, may cause the value of securities issued by issuers in such European countries to fall, in some cases drastically. These events may also cause continued volatility in the European financial markets. To the extent that the Fund’s assets are exposed to investments from issuers in European countries or denominated in euro, their trading partners, or other European countries, these events may negatively impact the performance of the Fund.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund’s performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund’s ability to obtain exposure to those foreign investments at appropriate times.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Europe, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Europe and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund’s stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund’s shares relative to the Index until the Fund’s next NAV calculation time will generally be greater than or less than the Fund’s stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors.

In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were

used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2013): 28.50%

Worst Quarter (ended 9/30/2011): -45.77%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 8.78%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-15.91%	7.98%	4/27/2010
After Taxes on Distributions	-15.91%	7.98%	—
After Taxes on Distributions and Sale of Shares	-9.00%	6.28%	—
FTSE Developed Europe Index <sup>#</sup>	-5.65%	7.12%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index. Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since April 2010.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MSCI Pacific ex-Japan (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the MSCI Pacific ex-Japan Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (5:00 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	4.38%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement*	5.13%
	-4.18%

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

0.95%

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$1,163	\$2,226	\$4,873

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a free-float-adjusted, market capitalization-weighted index that is designed to measure the equity market performance of the developed markets in the eastern Pacific region, excluding Japan. The Index is divided into large- and mid-cap segments and targets approximately 85% of free float-adjusted market capitalization of the region. As of June 30, 2015, the Index consists of the following 4 developed market countries/cities: Australia, Hong Kong, New Zealand and Singapore. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.2 billion and \$106.1 billion. The average capitalization of the companies comprising the Index was approximately \$10.5 billion. The Index is published under the Bloomberg ticker symbol "MXPCJ."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
  - American Depositary Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - Global Depositary Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financial services industry group, in Australia and Asia.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/ lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 16.76%. The Index's highest June to June volatility rate during the five-year period was 25.39% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 8.69%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- Geographic Concentration Risk** – Because the Fund focuses its investments in particular foreign countries or geographic regions, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in those foreign countries and geographic regions and subject to the related risks. In particular, the Australian economy is heavily dependent on exports from agricultural and mining sectors making it susceptible to fluctuations in the commodity markets. Australia is also dependent on trading with key trading partners.
- Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible

to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to "diversified" investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including "fair valued" securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 23.46%

Worst Quarter (ended 9/30/2011): -43.33%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.22%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-7.01%	4.17%	4/27/2010
After Taxes on Distributions	-7.01%	4.17%	—
After Taxes on Distributions and Sale of Shares	-3.97%	3.23%	—
MSCI Pacific ex-Japan Index#	14.66%	8.71%	—

# Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since April 2010.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MSCI Brazil Capped (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the MSCI Brazil 25/50 Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.28%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**2.03%**

Fee Waiver/Reimbursement\*

-1.08%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$532	\$993	\$2,272

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a free-float-adjusted, market capitalization-weighted index that is designed to measure the equity market performance of the Brazilian market. The Index is divided into large- and mid-cap segments and targets approximately 85% of free-float-adjusted market capitalization of the region. The Index is different from the MSCI Brazil Index<sup>®</sup>, as it is designed to limit exposure to large holdings to levels that comply with Internal Revenue Code diversification tests for regulated investment companies. Specifically, a capping methodology is applied that limits the weight of any single component to a maximum of 25% of the Index. Additionally, the sum of the components that individually constitute more than 5% of the weight of the Index cannot exceed a maximum of 50% of the Index in the aggregate. As of June 30, 2015, the Index included companies with capitalizations between approximately \$506.1 million and \$29.1 billion. The average capitalization of the companies comprising the Index was approximately \$4.5 billion. The Index is published under the Bloomberg ticker symbol “MXBR2550.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified

time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
  - American Depository Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - Global Depository Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in Brazil.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

Estimated Fund Returns

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index was created in November 2012. Since the inception of the Index, the Index's annualized historical volatility rate was 26.19%. The Index's highest June to June volatility rate since inception was 33.66% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was -8.26%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** — A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Consumer Goods Industry Risk** — The Fund is subject to risks faced by companies in the consumer goods economic sector to the same extent as the Index is so concentrated, including: governmental regulation affecting the permissibility of using various food additives and production methods that could affect profitability; new laws or litigation that may adversely affect tobacco companies; fads, marketing campaigns and other factors affecting supply and demand that may strongly affect securities prices and profitability of food, soft drink and fashion related products; and international events that may affect food and beverage companies that derive a substantial portion of their net income from foreign countries.
- **Counterparty Risk** — The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** — An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to

rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to Brazilian Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Brazil. Such risks include, but are not limited to (i) legal, regulatory, political and economic risks and (ii) risks related to high rates of inflation and high levels of debt, each of which may hinder economic growth.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign

investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Brazil, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Brazil and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors.

In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were

used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

- Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 25.12%

Worst Quarter (ended 9/30/2011): -52.17%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -21.15%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-36.32%	-26.34%	4/27/2010
After Taxes on Distributions	-36.32%	-26.34%	—
After Taxes on Distributions and Sale of Shares	-20.56%	-16.91%	—
MSCI Brazil 25/50 Index <sup>#</sup>	-14.05%	-9.36%*	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

\* Cumulative Total Return from 11/21/2012 (the inception date of the Index) to 12/31/2014.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since April 2010.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra FTSE China 50 (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the FTSE China 50 Index<sup>®</sup> (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (4:15 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.41%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$348	\$618	\$1,390

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily

return characteristics as two times (2x) the daily return of the Index. The Index is comprised of 50 of the largest and most liquid Chinese stocks listed on the Hong Kong Stock Exchange. As of June 30, 2015, the Index included companies with capitalizations between approximately \$11.6 billion and \$319.5 billion. The average capitalization of the companies comprising the Index was approximately \$70.2 billion. The Index is published under the Bloomberg ticker symbol "XINOI."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.
- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
  - American Depositary Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - Global Depositary Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type,

quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financials industry group and in China.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk

(each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any

set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 22.52%. The Index's highest June to June volatility rate during the five-year period was 31.65% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.15%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests.

The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in

financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to Chinese Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in China. Such risks include, but are not limited to (i) political, economic, or social instability in China; (ii) heightened risk of inefficiency, volatility and pricing anomalies of portfolio holdings resulting from governmental influence; (iii) natural disasters particularly likely to occur in China; and (iv) a lack of publicly available information (as compared to many other countries).

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.

- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Financials Industry Risk** – The Fund is subject to risks faced by companies in the financials economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financials sector. The impact of more stringent capital requirements, recent

or future regulation on any individual financial company or recent or future regulation on the financials economic sector as a whole cannot be predicted.

- **Geographic Concentration Risk** – Because the Fund focuses its investments only in China, it may be more volatile than a more geographically diversified fund. Investments in the People's Republic of China ("PRC") are subject to special risks, such as less developed or less efficient trading markets, currency fluctuations or blockage, nationalization of assets, limits on repatriation, uncertainty surrounding potential PRC income tax liability, trading suspensions, and the effects of governmental control of markets. In particular, the PRC markets have experienced significant volatility recently. Any actual or perceived reduction to the high levels of growth that the PRC economy and financial markets have experienced in recent years or curtailment in those levels of growth in the future would likely have a substantial adverse impact on the values of PRC companies. Investments in securities of PRC companies are subject to the PRC's heavy dependence on exports. A small number of companies and industries represent a relatively large portion of the PRC market as a whole. The performance of the Fund will be affected by the political, social and economic conditions in China and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and

the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Telecommunications Industry Risk** – The Fund is subject to risks faced by companies in the telecommunications economic sector to the same extent as the Index is so concentrated, including: a telecommunications market characterized by increasing competition and regulation by the relevant governmental authorities; the need to commit substantial capital to meet increasing competition, particularly in formulating new products and services using new technology; and technological innovations that may make various products and services obsolete. The telecommunications industry is also affected by risks that affect the narrower mobile telecommunications sector, including: dramatic securities price fluctuations; recent industry consolidation trends that may lead to increased

regulation in primary markets; and thin capitalization and limited product lines, markets financial resources or personnel.

- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2012): 36.89%

Worst Quarter (ended 9/30/2011): -50.55%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 20.24%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	19.57%	-0.58%	2.58%	6/2/2009
After Taxes on Distributions	19.57%	-0.58%	2.58%	—
After Taxes on Distributions and Sale of Shares	11.08%	-0.44%	1.99%	—
FTSE China 50 Index <sup>#</sup>	13.35%	2.77%	4.66%	—

#Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for

all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MSCI Japan (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the MSCI Japan Index® (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV per share each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to the time difference in determining the level of the Index (2:10 a.m., Eastern Time) and valuation of the Fund (4:00 p.m., Eastern Time).

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

## Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.52%

## Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

## Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

Fee Waiver/Reimbursement\*

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$371	\$666	\$1,506

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index includes 85% of free-float adjusted, market capitalization in each industry group in Japan. As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.0 billion and \$183.3 billion. The average capitalization of the companies comprising the Index was approximately \$9.5 billion. The Index is published under the Bloomberg ticker symbol "MXJP."

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.
- **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
  - American Depositary Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - Global Depositary Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in Japan.

Please see "Investment Objectives, Principal Investment Strategies and Related Risks" in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include

counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for

periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 18.63%. The Index's highest June to June volatility rate during the five-year period was 21.40% (June 30, 2011). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 8.80%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in

financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Consumer Services Industry Risk** – The Fund is subject to risks faced by companies in the consumer services industry to the same extent as the Index is so concentrated, including: the fact that securities prices and profitability may be tied closely to the performance of the domestic and international economy, interest rates, competition and consumer confidence; heavy dependence on disposable household income and consumer spending; severe competition; and changes in demographics and consumer tastes, which can affect the success of consumer products.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility

in the markets and/or market developments may cause the value of an investment in the Fund to decrease.

- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Exposure to Japanese Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Japan. Such risks include, but are not limited to (i) political, economic, or social instability in Japan; (ii) risks associated with Japan's large government deficit; (iii) natural disasters particularly likely to occur in Japan; and (iv) risks associated with an increasingly aging population that is likely to strain Japan's social welfare and pension systems.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Japan, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Japan and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as "non-diversified" under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a "non-diversified" investment company under the 1940 Act, the Fund intends to qualify as a "regulated investment company" ("RIC") accorded special tax

treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

## Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 23.86%

Worst Quarter (ended 6/30/2010): -22.04%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 29.10%.

## Average Annual Total Returns

As of December 31, 2014	One Year	Five Years	Since Inception	Inception Date
Before Taxes	-15.21%	4.11%	4.57%	6/2/2009
After Taxes on Distributions	-15.21%	4.11%	4.57%	—
After Taxes on Distributions and Sale of Shares	-8.61%	3.19%	3.57%	—
MSCI Japan Index <sup>#</sup>	-4.02%	5.48%	5.67%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor’s tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

## Management

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since December 2009.

## Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

## Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra MSCI Mexico Capped IMI (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the MSCI Mexico IMI 25/50 Index<sup>®</sup> (the “Index”) for that period.

**For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund’s NAV calculation time, the percentage change of the Fund’s NAV per share may differ, perhaps significantly, from two times (2x) the percentage change of the Index on a given day. As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage.**

**Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	1.75%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**2.50%**

Fee Waiver/Reimbursement\*

-1.55%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**0.95%**

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$630	\$1,191	\$2,719

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a free float-adjusted, market capitalization-weighted index that is designed to measure the equity market performance of the Mexican market by capturing 99% of the (publicly available) total market capitalization. Component companies must meet objective criteria for inclusion in the MSCI Mexico Investable Market Index<sup>®</sup>, taking into consideration unavailable strategic shareholdings and limitations to foreign ownership. The Index is different from the MSCI Mexico Investable Market Index<sup>®</sup>, as it is designed to limit exposure to large holdings to levels that comply with Internal Revenue Code diversification tests for regulated investment companies. Specifically, a capping methodology is applied that limits the weight of any single component to a maximum of 25% of the Index. Additionally, the sum of the components that individually constitute more than 5% of the weight of the Index cannot exceed a maximum of 50% of the Index in the aggregate. As of June 30, 2015, the Index included companies with capitalizations between approximately \$550.2 million and \$32.1 billion. The average capitalization of the companies comprising the Index was approximately \$3.5 billion. The Index is published under the Bloomberg ticker symbol “MXMX5IM.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Equity Securities** – The Fund invests in common stock issued by public companies.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in stocks in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.
  - **Depository Receipts** – The Fund may invest in depository receipts, which principally include:
    - American Depository Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
    - Global Depository Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors’ view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund’s investment objective. The Index’s movements during the day will affect whether the Fund’s portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund’s exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund’s exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day’s return over time, the return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index’s volatility and the effects of compounding. See “Principal Risks”, below.**

The Fund will concentrate its investments in a particular industry or group of industries, country or region to approximately the same extent as the Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the consumer staples industry group and in Mexico.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index

subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no dividends paid with respect to securities included in the Index; (b) no Fund expenses; and (c) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20% absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index was created in November 2012. Since the inception of the Index, the Index's annualized historical volatility rate was 20.11%. The Index's highest June to June volatility rate since inception was 28.37% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 4.92%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and

there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. Due to differences in trading hours between U.S. and foreign markets and because the level of the Index may be determined using prices obtained at times other than the Fund's NAV calculation time, correlation to the Index will generally be measured by comparing the daily change in the Fund's NAV per share to the performance of one or more U.S. ETFs that reflect the values of the securities underlying the Index as of the Fund's NAV calculation time.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

### Consumer Staples Industry Risk

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Equity and Market Risk** – The equity markets are volatile, and the value of securities, swaps, futures and other instruments correlated with the equity markets may fluctuate dramatically from day-to-day. Equity markets are subject to corporate, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. Further, stocks in the Index may underperform other equity investments. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease.
- **Exposure to Foreign Currency Risk** – Investments linked to or denominated in foreign currencies are exposed to additional risk factors versus those investments denominated in U.S. dollars and linked to U.S. investments. The value of an investment linked to or denominated in a foreign currency could change significantly as foreign currencies strengthen or weaken relative to the U.S. dollar. Devaluations of a currency by a government or banking authority may also have significant impact on the value of any investments linked to or denominated in that currency. Risks related to foreign currencies also include those related to economic or political developments, market inefficiencies or a higher risk that essential investment information may be incomplete, unavailable, or inaccurate. Foreign currency losses could offset or exceed any potential gains, or add to losses, in the related investments. Currency markets are also generally not as regulated as securities markets.
- **Exposure to Foreign Investments/Emerging Market Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition,

markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.

Because the Fund's foreign investments will include issuers domiciled in developing or "emerging market" countries, all the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political, or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign countries. Furthermore, any of these developments may result in a decline in the value of a country's currency. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging markets are considered speculative.

- **Exposure to Mexican Investments Risk** – The Fund is generally exposed, to a greater extent than more geographically diversified funds, to risks associated with investments in Mexico. Such risks include, but are not limited to (i) legal, regulatory and political instability in Mexico; (ii) high interest rates; (iii) economic volatility; (iv) high unemployment; (v) the Mexican economy is dependent upon external trade causing increased risk to the Mexican economy; and (vi) risk related to increased violence related to drug trafficking which could have an adverse effect on the Mexican economy and financial markets.
- **Geographic Concentration Risk** – Because the Fund focuses its investments only in Mexico, it may be more volatile than a more geographically diversified fund. The performance of the Fund will be affected by the political, social and economic conditions in Mexico and subject to the related risks.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.

- Market Price Variance Risk** – The Fund’s shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund’s shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund’s holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund’s holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund’s holdings should not be sustained. The Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund’s volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund’s performance. Notwithstanding the Fund’s status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund’s shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another

methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

- Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). In certain cases, foreign securities markets close before or after such time. As a result, the performance of the Fund’s NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund’s investment results have varied from year to year, and the table shows how the Fund’s average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund’s results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 3/31/2012): 33.73%

Worst Quarter (ended 9/30/2011): -41.56%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -8.19%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	-24.47%	2.75%	4/27/2010
After Taxes on Distributions	-24.47%	2.75%	—
After Taxes on Distributions and Sale of Shares	-13.85%	2.12%	—
MSCI Mexico IMI 25/50 Index® #	-9.81%	3.77%	—

# Reflects no deduction for fees, expenses or taxes. Returns are gross returns that do not reflect the reduction of any withholding taxes, and are adjusted to reflect the reinvestment of dividends paid by companies in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be

held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Alexander Ilyasov, Senior Portfolio Manager, has managed the Fund since April 2010.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra 7-10 Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Barclays U.S. 7-10 Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.27%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.02%</b>
Fee Waiver/Reimbursement*	-0.07%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

<b>1 Year</b>	<b>3 Years</b>	<b>5 Years</b>	<b>10 Years</b>
\$97	\$318	\$556	\$1,241

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 349% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity of between 7 and 10 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPS”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LTo9TRUU.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **U.S. Government Debt Securities** – The Fund invests in U.S. government securities, which are issued by the U.S. government or one

of its agencies or instrumentalities, including U.S. Treasury securities. Some, but not all, U.S. government securities are backed by the full faith and credit of the federal government. Other U.S. government securities are backed by the issuer's right to borrow from the U.S. Treasury and some are backed only by the credit of the issuing organization.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in debt in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or

analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a

dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/ lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 6.36%. The Index's highest June to June volatility rate during the five-year period was 7.41% (June 30, 2011). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 4.28%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund’s ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund’s ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index’s movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund’s correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund’s underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund’s ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.

- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.

- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund

currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2011): 20.74%

Worst Quarter (ended 6/30/2013): -8.49%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -0.64%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	17.41%	10.93%	1/19/2010
After Taxes on Distributions	14.86%	10.44%	—
After Taxes on Distributions and Sale of Shares	9.77%	8.44%	—
Barclays U.S. 7-10 Year Treasury Bond Index <sup>#</sup>	9.00%	5.95%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax

returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since January 2010.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 50,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra 20+ Year Treasury (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Barclays U.S. 20+ Year Treasury Bond Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	0.40%

<b>Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements</b>	<b>1.15%</b>
Fee Waiver/Reimbursement*	-0.20%

<b>Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements</b>	<b>0.95%</b>
--	--------------

\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements, as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$97	\$346	\$614	\$1,380

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund’s performance. During the most recent fiscal year, the Fund’s annual portfolio turnover rate was 48% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund’s portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in securities and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index includes all publicly issued, U.S. Treasury securities that have a remaining maturity greater than 20 years, are non-convertible, are denominated in U.S. dollars, are rated investment grade (at least Baa3 by Moody’s Investors Service, Inc. or BBB- by Standard and Poor’s Financial Services, LLC), are fixed rate, and have more than \$250 million par outstanding. The Index is weighted by the relative market value of all securities meeting the Index criteria. Excluded from the Index are certain special issues, such as targeted investor notes, U.S. Treasury inflation-protected securities (“TIPs”), state and local government series bonds, and coupon issues that have been stripped from Treasury securities. The Index is published under the Bloomberg ticker symbol “LT11TRUU.”

The securities and derivatives that the Fund will principally invest in are set forth below. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **U.S. Government Debt Securities** – The Fund invests in U.S. government securities, which are issued by the U.S. government or one

of its agencies or instrumentalities, including U.S. Treasury securities. Some, but not all, U.S. government securities are backed by the full faith and credit of the federal government. Other U.S. government securities are backed by the issuer's right to borrow from the U.S. Treasury and some are backed only by the credit of the issuing organization.

- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds (“ETFs”)), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in debt in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement.
- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or

analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See “Principal Risks”, below.**

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- **Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a

dramatic intraday move that causes a material decline in the Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor's investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder's investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.
- Compounding Risk** – The Fund has a single day investment objective, and the Fund's performance for periods greater than a single day will be the result of each day's returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund's investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/ lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund's performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

		Estimated Fund Returns				
One Year Index	Index Performance Two times (2x) the One Year Index	One Year Volatility Rate				
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 14.97%. The Index's highest June to June volatility rate during the five-year period was 20.09% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 6.50%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the**

**Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day.

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all securities in the Index, or its weighting of investment exposure to securities may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to

financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Fixed Income and Market Risk** – The U.S. Treasury market can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed Income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related financial instruments may fluctuate in value

due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.

- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities held by the Fund may be traded in markets that close at a different time than NYSE Arca. Because the Fund and the Index generally value such securities as of their bond market closing time, the daily NAV and Index performance will vary from the market performance of the Fund as of the NYSE Arca close (typically at 4:00 p.m., Eastern Time). Furthermore, liquidity in such securities may be reduced after the applicable closing times. This may cause wider spreads and larger premium and discounts than would otherwise be the case if each market was open until the close of trading on NYSE Arca. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's

investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.

- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. This risk may be particularly acute if the Index is comprised of a small number of securities. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a

broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 9/30/2011): 63.74%

Worst Quarter (ended 3/31/2012): -13.70%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -11.88%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	59.52%	18.94%	1/19/2010
After Taxes on Distributions	58.89%	18.70%	—
After Taxes on Distributions and Sale of Shares	33.64%	15.30%	—
Barclays U.S. 20+ Year Treasury Bond Index <sup>#</sup>	27.48%	10.59%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the

historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Michelle Liu, Portfolio Manager, has managed the Fund since January 2010.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra High Yield (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Markit iBoxx \$ Liquid High Yield Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 p.m.) and valuation of the Fund (4:00 p.m.). As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	5.16%
Acquired Fund Fees and Expenses*	0.31%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

**6.22%**

Fee Waiver/Reimbursement\*\*

**-4.96%**

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**1.26%**

\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (excluding Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$128	\$1,403	\$2,647	\$5,626

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a taxable account. These costs, which are not reflected in Annual Fund

Operating Expenses or in the example above, affect the Fund's performance. During the most recent fiscal year, the Fund's annual portfolio turnover rate was 387% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund's portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in exchange-traded funds and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a modified market-value weighted index designed to provide a balanced representation of U.S. dollar-denominated high yield corporate bonds for sale within the United States by means of including the most liquid high yield corporate bonds available as determined by the index provider. Currently, the bonds eligible for inclusion in the Index include U.S. dollar-denominated, corporate bonds for sale in the United States that are issued by companies domiciled in the U.S., Bermuda, Canada, Cayman Islands, Western Europe or Japan; are rated sub-investment grade by Moody's Investors Service, Inc., Fitch, Inc. or Standard and Poor's Financial Services, LLC; are from issuers with at least \$1 billion par outstanding; have at least \$400 million of outstanding face value; and are between three and fifteen years to maturity. There is no limit to the number of issues in the Index. Index rebalances occur monthly. The Index is published under the Bloomberg ticker symbol "IBOXHY."

The securities and derivatives that the Fund will principally invest in are set forth below. The Fund may invest up to 85% of its assets in ETFs. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Exchange-Traded Funds (ETFs)** – The Fund may invest in shares of other ETFs, which are registered investment companies that are traded on stock exchanges and hold assets such as stocks or bonds.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in debt in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.

- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the Index is so concentrated.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

**Estimated Fund Returns**

Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index					
		10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 4.20%. The Index's highest June to June volatility rate during the five-year period was 6.80% (June 29, 2012). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 7.78%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 pm) and the valuation of the Fund (4:00 pm).

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of

derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all bonds in the Index, or its weighting of investment exposure to bonds may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.
- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities.
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the

maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change.

- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.
- **High Yield Risk** – Investment in or exposure to high yield (lower rated) debt instruments (also known as "junk bonds") may involve greater levels of credit, prepayment, liquidity and valuation risk than for higher rated instruments. High yield debt instruments may be more sensitive to economic changes, political changes, or adverse developments specific to a company than other fixed income instruments. These securities are subject to greater risk of loss, greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market for securities. High yield debt instruments are considered speculative with respect to the issuer's continuing ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than higher rated debt instruments. An economic downturn or period of rising interest rates could adversely affect the market for these securities and reduce market liquidity (liquidity risk). Less active markets may diminish the Fund's ability to obtain accurate market quotations when valuing the portfolio securities and thereby give rise to valuation risk. High yield debt instruments may also present risks based on payment expectations. For example, these instruments may contain redemption or call provisions. If an issuer exercises these provisions in a declining interest rate market, the Fund would have to replace the security with a lower yielding security, resulting in a decreased return for investors. If the issuer of a security is in default with respect to interest or principal payments, the issuer's security could lose its entire value. Furthermore, the transaction costs associated with the purchase and sale of high yield debt instruments may vary greatly depending upon a number of factors and may adversely affect the Fund's performance.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related/certain financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective of corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.
- **Risk of Investing in Exchange-Traded Funds (ETFs)** – Investing in other investment companies, such as ETFs, subjects the Fund to those risks affecting the underlying ETFs, such as risks that the investment management strategy of the ETF may not produce its intended results (management risk) and the risk that the ETF could lose money over short periods due to short-term market movements and over longer periods during market downturns (market risk). In addition, investing in ETFs

involves the risk that an ETF's performance may not track the performance of the index or markets that the ETF is designed to track, which may result in losses to such ETF and, ultimately, the Fund. Moreover, the Fund will incur its pro rata share of the expenses of the underlying ETF's expenses.

- **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
- **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
- **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment

company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.

- **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
- **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
- **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). Bond markets typically close before such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.

## Investment Results

The bar chart below shows how the Fund's investment results have varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

### Annual Returns as of December 31 each year

Best Quarter (ended 12/31/2013): 6.76%

Worst Quarter (ended 6/30/2013): -4.93%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was 2.07%.

### Average Annual Total Returns

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	2.37%	10.00%	4/13/2011
After Taxes on Distributions	2.24%	9.96%	—
After Taxes on Distributions and Sale of Shares	1.35%	7.83%	—
Markit iBoxx \$ Liquid High Yield Index <sup>#</sup>	2.13%	6.18%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x). Shareholders should actively manage and monitor their investments, as frequently as daily.

### Management

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since April 2011.

### Purchase and Sale of Fund Shares

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

### Tax Information

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

## Important Information About the Fund

ProShares Ultra Investment Grade Corporate (the “Fund”) seeks investment results **for a single day only**, not for longer periods. A “single day” is measured from the time the Fund calculates its net asset value (“NAV”) to the time of the Fund’s next NAV calculation. The return of the Fund for periods longer than a single day will be the result of each day’s returns compounded over the period, which will very likely differ from two times (2x) the return of the Markit iBoxx \$ Liquid Investment Grade Index (the “Index”) for that period. **For periods longer than a single day, the Fund will lose money when the level of the Index is flat, and it is possible that the Fund will lose money even if the level of the Index rises.** Longer holding periods, higher index volatility and greater leverage each exacerbate the impact of compounding on an investor’s returns. During periods of higher Index volatility, the volatility of the Index may affect the Fund’s return as much as or more than the return of the Index.

The percentage change of the Fund’s NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on that day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 p.m.) and valuation of the Fund (4:00 p.m.). As such, correlation to the Index will generally be measured by comparing the daily change in the Fund’s NAV per share to the performance of one or more U.S. exchange-traded funds (“ETFs”) that reflect the values of the securities underlying the Index as of the Fund’s NAV calculation time.

**The Fund is different from most exchange-traded funds in that it seeks leveraged returns relative to the Index and only on a daily basis. The Fund also is riskier than similarly benchmarked exchange-traded funds that do not use leverage. Accordingly, the Fund may not be suitable for all investors and should be used only by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results. Shareholders should actively manage and monitor their investments, as frequently as daily.**

## Investment Objective

The Fund seeks daily investment results, before fees and expenses, that correspond to two times (2x) the daily performance of the Index. **The Fund does not seek to achieve its stated investment objective over a period of time greater than a single day.**

## Fees and Expenses of the Fund

The table below describes the fees and expenses that you may pay if you buy or hold shares of the Fund.

### Annual Fund Operating Expenses

(expenses that you pay each year as a percentage of the value of your investment)

Investment Advisory Fees	0.75%
Other Expenses	4.85%
Acquired Fund Fees and Expenses*	0.10%

### Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements

	<b>5.70%</b>
Fee Waiver/Reimbursement**	-4.65%

### Total Annual Fund Operating Expenses After Fee Waivers and Expense Reimbursements

**1.05%**

\* “Acquired Fund Fees and Expenses” are expenses incurred indirectly by the Fund through its ownership of shares in other investment companies (such as business development companies and/or exchange-traded funds). They are not direct costs paid by Fund shareholders and are not used to calculate the Fund’s net asset value (“NAV”). “Acquired Fund Fees and Expenses” are not directly borne by the Fund and are not reflected in the Fund’s Financial Statements in the annual report. Therefore, the amounts listed in “Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements” will differ from those presented in the Fund’s Financial Highlights in the back of the Full Prospectus.

\*\* ProShare Advisors LLC (“ProShare Advisors”) has contractually agreed to waive Investment Advisory and Management Services Fees and to reimburse Other Expenses to the extent Total Annual Fund Operating Expenses Before Fee Waivers and Expense Reimbursements (excluding Acquired Fund Fees and Expenses), as a percentage of average daily net assets, exceed 0.95% through September 30, 2016. After such date, the expense limitation may be terminated or revised by ProShare Advisors. Amounts waived or reimbursed in a particular contractual period may be recouped by ProShare Advisors within five years of the end of that contractual period to the extent that recoupment will not cause the Fund’s expenses to exceed any expense limitation in place at that time.

**Example:** This example is intended to help you compare the cost of investing in the Fund with the cost of investing in other funds.

The example assumes that you invest \$10,000 in the Fund for the time periods indicated and then redeem all of your shares at the end of each period. The example also assumes that your investment has a 5% return each year and that the Fund’s operating expenses remain the same, except that the fee waiver/expense reimbursement is assumed only to pertain to the first year. Although your actual cost may be higher or lower, based on these assumptions your approximate costs would be:

1 Year	3 Years	5 Years	10 Years
\$107	\$1,284	\$2,444	\$5,275

The Fund pays transaction and financing costs associated with the purchase and sale of securities and derivatives. In addition, investors may pay brokerage commissions on their purchases and sales of the Fund’s shares. These costs are not reflected in the table or the example above.

## Portfolio Turnover

The Fund pays transaction costs, such as commissions, when it buys and sells securities (or “turns over” its portfolio). A higher portfolio turnover may indicate higher transaction costs and may result in higher taxes when the Fund’s shares are held in a

taxable account. These costs, which are not reflected in Annual Fund Operating Expenses or in the example above, affect the Fund's performance. During the most recent fiscal year, the Fund's annual portfolio turnover rate was 0% of the average value of its entire portfolio. This portfolio turnover rate is calculated without regard to cash instrument or derivatives transactions. If such transactions were included, the Fund's portfolio turnover rate would be significantly higher.

## Principal Investment Strategies

The Fund invests in exchange-traded funds and derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as two times (2x) the daily return of the Index. The Index is a modified market-value weighted index designed to provide a balanced representation of U.S. dollar-denominated investment grade corporate bonds publicly offered in the United States by means of including the most liquid investment grade corporate bonds available as determined by the index provider. Currently, the bonds eligible for inclusion in the Index include U.S. dollar-denominated corporate bonds publicly offered in the United States that are issued by companies domiciled in the U.S., Bermuda, Canada, Cayman Islands, Western Europe or Japan; are rated investment grade by Moody's Investors Service, Inc., Fitch, Inc. or Standard and Poor's Financial Services, LLC; are from issuers with at least \$3 billion par outstanding; have at least \$750 million of outstanding face value; and have at least three years remaining to maturity. There is no limit to the number of issues in the Index. Index rebalances occur monthly. The Index is published under the Bloomberg ticker symbol "IBOXIG."

The securities and derivatives that the Fund will principally invest in are set forth below. The Fund may invest up to 85% of its assets in ETFs. Cash balances arising from the use of derivatives will typically be held in money market instruments.

- **Exchange-Traded Funds (ETFs)** – The Fund may invest in shares of other ETFs, which are registered investment companies that are traded on stock exchanges and hold assets such as stocks or bonds.
- **Derivatives** – The Fund invests in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. The Fund invests in derivatives as a substitute for investing directly in debt in order to gain leveraged exposure to the Index. These derivatives principally include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.

- **Money Market Instruments** – The Fund invests in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

ProShare Advisors uses a mathematical approach to investing. Using this approach, ProShare Advisors determines the type, quantity and mix of investment positions that the Fund should hold to approximate, on a daily basis, the performance of two times (2x) the Index. The Fund may invest in or gain exposure to only a representative sample of the securities in the Index or to securities not contained in the Index or in financial instruments, with the intent of obtaining exposure with aggregate characteristics similar to those of a multiple of the Index. ProShare Advisors does not invest the assets of the Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, nor does it conduct conventional investment research or analysis or forecast market movement or trends, in managing the assets of the Fund. The Fund seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide leveraged exposure to the Index without regard to market conditions, trends or direction. The Fund seeks investment results for a single day only as calculated from NAV to NAV, not for longer periods.

At the close of the U.S. securities markets on each trading day, the Fund will seek to position its portfolio so that its exposure to the Index is consistent with the Fund's investment objective. The Index's movements during the day will affect whether the Fund's portfolio needs to be repositioned. For example, if the Index has risen on a given day, net assets of the Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the Index has fallen on a given day, net assets of the Fund should fall. As a result, the Fund's exposure will need to be decreased.

**Because of daily rebalancing and the compounding of each day's return over time, the return of the Fund for periods longer than a single day will be the result of each day's returns compounded over the period, which will very likely differ from two times (2x) the return of the Index over the same period. The Fund will lose money if the level of the Index is flat over time, and it is possible that the Fund will lose money over time even if the level of the Index rises, as a result of daily rebalancing, the Index's volatility and the effects of compounding. See "Principal Risks", below.**

The Fund will concentrate its investments in a particular industry or group of industries to approximately the same extent as the

Index is so concentrated. As of the close of business on June 30, 2015, the Index was concentrated in the financial services industry group.

Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund’s Full Prospectus for additional details.

## Principal Risks

### You could lose money by investing in the Fund.

- Risks Associated with the Use of Derivatives** – The Fund obtains investment exposure through derivatives. Investing in derivatives may be considered aggressive and may expose the Fund to greater risks than investing directly in the reference asset(s) underlying those derivatives. These risks include counterparty risk, liquidity risk and increased correlation risk (each as discussed below). When the Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require only a limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested. The Fund may use a combination of swaps on the Index and swaps on an ETF that is designed to track the performance of the Index. The performance of an ETF may not track the performance of the Index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with the Index as it would if the Fund only used swaps on the Index. Moreover, with respect to the use of swap agreements, if the Index has a dramatic intraday move that causes a material decline in the Fund’s net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund’s investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the Index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund’s return.
- Leverage Risk** – The Fund obtains investment exposure in excess of its assets in seeking to achieve its investment objective—a form of leverage—and will lose more money in market environments adverse to its daily objective than a similar fund that does not employ such leverage. The use of such leverage could result in the total loss of an investor’s investment. For example, because the Fund includes a multiplier of two times (2x) the Index, a single day movement in the Index approaching 50% at any point in the day could result in the total loss of a shareholder’s investment if that movement is contrary to the investment objective of the Fund, even if the Index subsequently moves in an opposite direction, eliminating all or a portion of the earlier movement. This would be the case with

any such single day movements in the Index, even if the Index maintains a level greater than zero at all times.

- Compounding Risk** – The Fund has a single day investment objective, and the Fund’s performance for periods greater than a single day will be the result of each day’s returns compounded over the period, which is likely to be either better or worse than the Index performance times the stated multiple in the Fund’s investment objective, before accounting for fees and fund expenses. Compounding affects all investments, but has a more significant impact on a leveraged fund. Particularly during periods of higher Index volatility, compounding will cause results for periods longer than a single day to vary from two times (2x) the return of the Index. This effect becomes more pronounced as volatility increases. Fund performance for periods greater than a single day can be estimated given any set of assumptions for the following factors: a) Index volatility; b) Index performance; c) period of time; d) financing rates associated with leveraged exposure; e) other Fund expenses; and f) dividends or interest paid with respect to securities in the Index. The chart below illustrates the impact of two principal factors—Index volatility and Index performance—on Fund performance. The chart shows estimated Fund returns for a number of combinations of Index volatility and Index performance over a one-year period. Performance shown in the chart assumes: (a) no Fund expenses; and (b) borrowing/lending rates (to obtain leveraged exposure) of zero percent. If Fund expenses and/or actual borrowing/lending rates were reflected, the Fund’s performance would be different than shown.

Areas shaded darker represent those scenarios where the Fund can be expected to return less than two times (2x) the performance of the Index.

Estimated Fund Returns						
Index Performance		One Year Volatility Rate				
One Year Index	Two times (2x) the One Year Index	10%	25%	50%	75%	100%
-60%	-120%	-84.2%	-85.0%	-87.5%	-90.9%	-94.1%
-50%	-100%	-75.2%	-76.5%	-80.5%	-85.8%	-90.8%
-40%	-80%	-64.4%	-66.2%	-72.0%	-79.5%	-86.8%
-30%	-60%	-51.5%	-54.0%	-61.8%	-72.1%	-82.0%
-20%	-40%	-36.6%	-39.9%	-50.2%	-63.5%	-76.5%
-10%	-20%	-19.8%	-23.9%	-36.9%	-53.8%	-70.2%
0%	0%	-1.0%	-6.1%	-22.1%	-43.0%	-63.2%
10%	20%	19.8%	13.7%	-5.8%	-31.1%	-55.5%
20%	40%	42.6%	35.3%	12.1%	-18.0%	-47.0%
30%	60%	67.3%	58.8%	31.6%	-3.7%	-37.8%
40%	80%	94.0%	84.1%	52.6%	11.7%	-27.9%
50%	100%	122.8%	111.4%	75.2%	28.2%	-17.2%
60%	120%	153.5%	140.5%	99.4%	45.9%	-5.8%

The foregoing table is intended to isolate the effect of Index volatility and Index performance on the return of the Fund. For example, the Fund may incorrectly be expected to achieve a -40% return on a yearly basis if the Index return were -20%, absent the effects of compounding. However, as the table shows, with Index volatility of 50%, the Fund could be expected to return -50.2% under such a scenario. The Fund's actual returns may be significantly better or worse than the returns shown above as a result of any of the factors discussed above or in "Principal Risks—Correlation Risk" below.

The Index's annualized historical volatility rate for the five-year period ended June 30, 2015 was 4.65%. The Index's highest June to June volatility rate during the five-year period was 5.25% (June 30, 2015). The Index's annualized total return performance for the five-year period ended June 30, 2015 was 7.78%.

Historical Index volatility and performance are not indications of what the Index volatility and performance will be in the future.

**For additional graphs and charts demonstrating the effects of Index volatility and Index performance on the long-term performance of the Fund, see "Principal Risks of Geared Funds and the Impact of Compounding" in the back of the Fund's Full Prospectus and "Special Note Regarding the Correlation Risks of Geared Funds" in the Fund's Statement of Additional Information.**

- **Correlation Risk** – A number of factors may affect the Fund's ability to achieve a high degree of correlation with the Index, and there is no guarantee that the Fund will achieve a high degree

of correlation. Failure to achieve a high degree of correlation may prevent the Fund from achieving its investment objective, and the percentage change of the Fund's NAV each day may differ, perhaps significantly, from two times (2x) the percentage change of the Index on such day. This is due primarily to (a) the impact of a limited trading market in the component Index bonds on the calculation of the Index, and (b) the time difference in calculation of the Index (3:00 pm) and the valuation of the Fund (4:00 pm).

In order to achieve a high degree of correlation with the Index, the Fund seeks to rebalance its portfolio daily to keep exposure consistent with its investment objective. Being materially over- or underexposed to the Index may prevent the Fund from achieving a high degree of correlation with the Index. Market disruptions or closure, regulatory restrictions or extreme market volatility will adversely affect the Fund's ability to adjust exposure to requisite levels. The target amount of portfolio exposure is impacted dynamically by the Index's movements. Because of this, it is unlikely that the Fund will have perfect exposure (i.e., 2x) to the Index at the end of each day and the likelihood of being materially over- or underexposed is higher on days when the Index level is volatile near the close of the trading day.

A number of other factors may also adversely affect the Fund's correlation with the Index, including fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which the Fund invests. The Fund may not have investment exposure to all bonds in the Index, or its weighting of investment exposure to bonds may be different from that of the Index. In addition, the Fund may invest in securities not included in the Index or in financial instruments. The Fund may take or refrain from taking positions in order to improve tax efficiency, or comply with regulatory restrictions, either of which may negatively affect the Fund's correlation with the Index. The Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to the Index and may be impacted by Index reconstitutions and Index rebalancing events. Additionally, the Fund's underlying investments and/or reference assets may trade on markets that may not be open on the same day as the Fund, which may cause a difference between the changes in the daily performance of the Fund and changes in the level of the Index. Any of these factors could decrease correlation between the performance of the Fund and the Index and may hinder the Fund's ability to meet its daily investment objective on or around that day.

Also, the Fund will measure its correlation to the performance of one or more ETFs. It is important to note that correlation to these ETFs may vary from the correlation to the Index due to embedded costs and other factors.

- **Counterparty Risk** – The Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely

payments to meet its contractual obligations) with respect to the amount it expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. If a counterparty becomes bankrupt or fails to perform its obligations, the value of an investment in the Fund may decline.

- **Credit Risk** – Due to its exposure to debt securities, the Fund will be subject to the risk that an issuer of a debt security is unwilling or unable to make timely payments to meet its contractual obligations. At times when credit risk increases, the price of the debt securities that comprise the Index (and therefore the value of the Fund) will typically decrease. Conversely, when credit risk of the debt securities decreases, the level of the Index (and the value of the Fund) will typically increase. In using sampling techniques, the Fund may be overexposed to certain securities that would adversely affect the Fund upon the markets' perceived view of increased credit risk or upon a downgrade or default of such securities
- **Debt Instrument Risk** – The Fund invests in, or seeks exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as the Fund may be required to reinvest the proceeds at lower interest rates. These factors may cause the value of an investment in the Fund to change.
- **Early Close/Late Close/Trading Halt Risk** – An exchange or market may close early, close late or issue trading halts on specific securities, or the ability to buy or sell certain securities or financial instruments may be restricted, which may result in the Fund being unable to buy or sell certain securities or financial instruments. In these circumstances, the Fund may be unable to rebalance its portfolio, may be unable to accurately price its investments and/or may incur substantial trading losses.
- **Exposure to Foreign Investments Risk** – Exposure to securities of foreign issuers may provide the Fund with increased risk. Various factors related to foreign investments may negatively impact the Fund's performance, such as: i) the possibility that a foreign government may withhold portions of interest and dividends at the source; ii) less publicly available information about foreign issuers; and iii) less certain legal systems in which the Fund might encounter difficulties or be unable to pursue legal remedies. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case with U.S. securities. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, the Fund's ability to obtain exposure to those foreign investments at appropriate times.
- **Financial Services Industry Risk** – The Fund is subject to risks faced by companies in the financial services economic sector to the same extent as the Index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financial sector.
- **Fixed Income and Market Risk** – The fixed income markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market or economic developments, as well as developments that impact specific economic sectors, industries or segments of the market. These factors may also lead to increased volatility and reduced liquidity in the bond markets. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in the Fund to decrease. Further, fixed income securities in the Index may underperform other fixed income investments that track other markets, segments and sectors.
- **Interest Rate Risk** – Interest rate risk is the risk that debt securities or related/certain financial instruments may fluctuate in value due to changes in interest rates. A wide variety of factors can cause interest rates to rise (e.g., central bank monetary policies, inflation rates, general economic conditions, etc.). This is especially true under current economic conditions because interest rates are at historically low levels. Thus, the Fund currently faces a heightened level of interest rate risk, especially since the Federal Reserve Board concluded its quantitative easing program. Commonly, investments subject to interest rate risk will decrease in value when interest rates rise and increase in value when interest rates decline. The value of securities with longer maturities may fluctuate more in response to interest rate changes than securities with shorter maturities.
- **Intraday Price Performance Risk** – The Fund is rebalanced at or about the time of its NAV calculation. As such, the intraday position of the Fund will generally be different from the Fund's stated investment objective corresponding to two times (2x) the Index. When shares are bought intraday, the performance of the Fund's shares relative to the Index until the Fund's next NAV calculation time will generally be greater than or less than the Fund's stated multiple.

- **Risk of Investing in Exchange-Traded Funds (ETFs)** – Investing in other investment companies, such as ETFs, subjects the Fund to those risks affecting the underlying ETFs, such as risks that the investment management strategy of the ETF may not produce its intended results (management risk) and the risk that the ETF could lose money over short periods due to short-term market movements and over longer periods during market downturns (market risk). In addition, investing in ETFs involves the risk that an ETF's performance may not track the performance of the index or markets that the ETF is designed to track, which may result in losses to such ETF and, ultimately, the Fund. Moreover, the Fund will incur its *pro rata* share of the expenses of the underlying ETF's expenses.
  - **Liquidity Risk** – In certain circumstances, such as the disruption of the orderly markets for the securities or financial instruments in which the Fund invests, the Fund might not be able to acquire or dispose of certain holdings quickly or at prices that represent true market value in the judgment of ProShare Advisors. Markets for the securities or financial instruments in which the Fund invests may be disrupted by a number of events, including but not limited to economic crises, natural disasters, new legislation, or regulatory changes inside or outside of the U.S. For example, regulation limiting the ability of certain financial institutions to invest in certain securities would likely reduce the liquidity of those securities. These situations may prevent the Fund from limiting losses, realizing gains or achieving a high correlation with the Index.
  - **Market Price Variance Risk** – The Fund's shares are listed for trading on NYSE Arca and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund's holdings, supply and demand for shares and other market factors. In addition, the securities in the Index may be traded in markets that close at a different time than NYSE Arca. Consequently, liquidity in such securities may be reduced after the applicable closing times. Accordingly, during the time when NYSE Arca is open but after the applicable closing times, trading spreads and the resulting premium or discount on the Fund's shares may widen. As a result, the performance of the market price of the Fund may vary, perhaps significantly, from the value of the Fund's holdings and the performance of the Index. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of the Fund's holdings. Given the fact that shares can be created and redeemed in Creation Units, as defined below, ProShare Advisors believes that large discounts or premiums to the value of the Fund's holdings should not be sustained. The Fund's investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming directly with the Fund.
  - **Non-Diversification Risk** – The Fund is classified as “non-diversified” under the Investment Company Act of 1940, and has the ability to invest a relatively high percentage of its assets in the securities of a small number of issuers susceptible to a single economic, political or regulatory event, or in financial instruments with a single counterparty or a few counterparties. This may increase the Fund's volatility and cause performance of a relatively smaller number of issuers or the credit of one or a relatively smaller number of counterparties to have a greater impact on the Fund's performance. Notwithstanding the Fund's status as a “non-diversified” investment company under the 1940 Act, the Fund intends to qualify as a “regulated investment company” (“RIC”) accorded special tax treatment under the Internal Revenue Code, which imposes its own diversification requirements that are less restrictive than the requirements applicable to “diversified” investment companies under the 1940 Act.
  - **Portfolio Turnover Risk** – Daily rebalancing of Fund holdings, which is required to keep leverage consistent with a single day investment objective, will cause a higher level of portfolio transactions than compared to most exchange-traded funds. Additionally, active market trading of the Fund's shares may cause more frequent creation or redemption activities that could, in certain circumstances, increase the number of portfolio transactions. High levels of transactions increase brokerage and other transaction costs and may result in increased taxable capital gains.
  - **Valuation Risk** – In certain circumstances, portfolio securities may be valued using techniques other than market quotations. The value established for a portfolio security may be different from what would be produced through the use of another methodology or if it had been priced using market quotations. Portfolio securities that are valued using techniques other than market quotations, including “fair valued” securities, may be subject to greater fluctuation in their value from one day to the next than would be the case if market quotations were used. In addition, there is no assurance that a Fund could sell a portfolio security for the value established for it at any time, and it is possible that the Fund would incur a loss because a portfolio security is sold at a discount to its established value.
  - **Valuation Time Risk** – The Fund typically values its portfolio at 4:00 p.m. (Eastern Time). Bond markets typically close before such time. As a result, the performance of the Fund's NAV may vary, perhaps significantly, from two times (2x) the daily performance of the Index.
- Please see “Investment Objectives, Principal Investment Strategies and Related Risks” in the back of the Fund's Full Prospectus for additional details.
- ### Investment Results
- The bar chart below shows how the Fund's investment results varied from year to year, and the table shows how the Fund's average annual total returns for various periods compare with a broad measure of market performance. This information provides some indication of the risks of investing in the Fund. Past results (before and after taxes) are not predictive of future results. Updated information on the Fund's results can be obtained by visiting ProShares.com.

**Annual Returns as of December 31 each year**

Best Quarter (ended 9/30/2012): 8.76%

Worst Quarter (ended 6/30/2013): -9.13%

The year-to-date return as of the most recent quarter, which ended June 30, 2015, was -4.28%.

**Average Annual Total Returns**

As of December 31, 2014	One Year	Since Inception	Inception Date
Before Taxes	15.22%	11.72%	4/13/2011
After Taxes on Distributions	15.19%	11.71%	—
After Taxes on Distributions and Sale of Shares	8.62%	9.23%	—
Markit iBoxx \$ Liquid Investment Grade Index <sup>#</sup>	8.66%	6.87%	—

<sup>#</sup> Reflects no deduction for fees, expenses or taxes. Adjusted to reflect the reinvestment of coupons paid by issuers in the Index. Since inception returns are calculated from the date the Fund commenced operations, not the date of inception of the Index.

Average annual total returns are shown on a before- and after-tax basis for the Fund. After-tax returns are calculated using the historical highest individual federal marginal income tax rates and do not reflect the impact of state and local taxes. Actual after-tax returns depend on an investor's tax situation and may differ from

those shown. After-tax returns shown are not relevant to investors who hold shares through tax-deferred arrangements, such as a retirement account. After-tax returns may exceed the return before taxes due to a tax benefit from realizing a capital loss on a sale of shares.

Annual returns are required to be shown and should not be interpreted as suggesting that the Fund should or should not be held for longer periods of time. The Fund may not be suitable for all investors and should only be used by knowledgeable investors who understand the potential consequences of seeking daily leveraged investment results (i.e., 2x).

Shareholders should actively manage and monitor their investments, as frequently as daily.

**Management**

The Fund is advised by ProShare Advisors. Jeffrey Ploshnick, Senior Portfolio Manager, has managed the Fund since April 2011.

**Purchase and Sale of Fund Shares**

The Fund will issue and redeem shares only to Authorized Participants (typically broker-dealers) in exchange for the deposit or delivery of a basket of assets (securities and/or cash) in large blocks, known as Creation Units, each of which is comprised of 25,000 shares. Retail investors may only purchase and sell shares on a national securities exchange through a broker-dealer. Because the Fund's shares trade at market prices rather than at NAV, shares may trade at a price greater than NAV (a premium) or less than NAV (a discount).

**Tax Information**

Income and capital gain distributions you receive from the Fund generally are subject to federal income taxes and may also be subject to state and local taxes. The Fund intends to distribute income, if any, quarterly, and capital gains, if any, at least annually. Distributions for this Fund may be higher than those of most ETFs.

# Investment Objectives, Principal Investment Strategies and Related Risks

This section contains additional details about the Funds' investment objectives, principal investment strategies and related risks.

## Investment Objectives

Each series of ProShares (each, a "Fund" and, collectively, the "Funds") is either an "actively-managed" fund, a "matching" fund or a "geared" fund. An "actively-managed" fund utilizes active management investment strategies to meet its investment objective (i.e., it is not a passively managed fund based on an underlying index). ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF are each actively managed funds (each, an "Actively Managed ProShares Fund", and collectively, the "Actively Managed ProShares Funds"). Each Actively Managed ProShares Fund seeks to provide long or inverse exposure to the credit of debt issuers.

A "matching" fund seeks to provide investment results, before fees and expenses, that correspond to the return of its underlying index (the term "index," as used herein, includes the Merrill Lynch Factor Model–Exchange Series benchmark). ProShares Morningstar Alternatives Solution ETF, ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares Large Cap Core Plus, ProShares S&P MidCap 400 Dividend Aristocrats ETF, ProShares Russell 2000 Dividend Growers ETF, ProShares S&P 500 Dividend Aristocrats ETF, ProShares MSCI EAFE Dividend Growers ETF, Hedged FTSE Europe ETF, Hedged FTSE Japan ETF, ProShares High Yield–Interest Rate Hedged, ProShares Investment Grade–Interest Rate Hedged, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF, ProShares Short Term USD Emerging Markets Bond ETF, ProShares Hedge Replication ETF, ProShares Merger ETF, ProShares RAFI™ Long/Short and ProShares 30 Year TIPS/TSY Spread are each "matching" funds (each, a "Matching ProShares Fund", and collectively, the "Matching ProShares Funds").

Each of the other Funds is a "Geared Fund" in the sense that each is designed to seek daily investment results, before fees and expenses, that correspond to the performance of a daily benchmark such as the inverse (-1x), multiple (i.e., 2x or 3x), or inverse multiple (i.e., -2x or -3x) of the daily performance of an index for a single day, not for any other period. The "Short ProShares Funds" (i.e., the Geared Funds that have the prefix "Short", "UltraShort" or "UltraPro Short" in their names) are designed to correspond to the inverse or an inverse multiple of the daily performance of an index. The "Ultra ProShares Funds" (i.e., the Geared Funds that have the prefix "Ultra" or "UltraPro" in their names) are designed to correspond to a multiple of the daily performance of an index.

The Short ProShares Funds and the Ultra ProShares Funds do not seek to achieve their stated investment objective over a period of time greater than a single day. A "single day" is measured from the time a Fund calculates its net asset value ("NAV") to the time of the Fund's next NAV calculation. The Actively Managed ProShares Funds and the Matching ProShares Funds each seek to achieve their stated investment objective both on a single day and over time. Each Fund's investment objective is non-fundamental, meaning that it may be changed by the Board of Trustees (the

"Board") of ProShares Trust (the "Trust"), without the approval of Fund shareholders. Each Matching ProShares Fund, Short ProShares Fund and Ultra ProShares Fund (together, the "Index Funds") reserves the right to substitute a different index or security for its current index.

## Principal Investment Strategies

### *Actively Managed ProShares Funds*

The Actively Managed ProShares Funds employ various techniques that ProShare Advisors LLC ("ProShare Advisors") believes should, in the aggregate, meet the objectives of the Fund. In seeking to achieve an Actively Managed ProShares Fund's investment objective, ProShare Advisors takes into consideration, among other things, the relative liquidity of and transaction costs associated with a particular investment.

Each Actively Managed ProShares Fund seeks to achieve its investment objective primarily through investing in a portfolio of credit derivatives whose underlying reference entities are debt issuers from their respective markets. ProShare Advisors will actively manage the Fund, selecting credit derivatives based on the following primary considerations:

- Diversification – maintaining broadly diversified exposure to the credit of debt issuers from the Fund's respective credit market;
- Liquidity – favoring credit derivatives with greater relative liquidity; and
- Sensitivity to Changes in Credit Quality – generally favoring credit derivatives having greater sensitivity to changes in credit quality.

ProShare Advisors may, at times, also consider other factors such as the relative value of one credit derivative versus another. ProShares CDS North American HY Credit ETF seeks to increase in value as its relevant overall credit market improves (i.e., the likelihood of payment by issuers in its relevant overall credit market increases), while also seeking to limit the impact of a change in the credit quality of any single debt issuer. ProShares CDS Short North American HY Credit ETF seeks to increase in value as its relevant overall credit market declines (i.e., the likelihood of payment by issuers in its relevant overall credit market decreases), while also seeking to limit the impact of a change in the credit quality of any single debt issuer. Credit markets are commonly considered to be improving when credit spreads (i.e., the level of additional yield that is paid on corporate bonds as compared to Treasury securities) are generally decreasing. Credit markets are commonly considered to be declining when credit spreads (i.e., the level of additional yield that is paid on corporate bonds as compared to Treasury securities) are generally increasing.

The use of credit default swaps to obtain long credit exposure is also expected to generate ordinary income.

### *Index Funds*

In seeking to achieve each Index Fund's investment objective, ProShare Advisors follows a passive approach to investing that is

designed to track the performance, inverse performance, or multiple thereof, of its index. Each Index Fund attempts to achieve its investment objective by investing all, or substantially all, of its assets in investments that make up its index or in financial instruments that provide similar exposure.

The Index Funds employ various investment techniques that ProShare Advisors believes should, in the aggregate, simulate the movement, inverse, or multiple thereof, as applicable, of each Fund's index. The investment techniques utilized to simulate the movement of each applicable index are intended to enhance liquidity, maintain a tax-efficient portfolio and reduce transaction costs, while, at the same time, seeking to maintain high correlation with, and similar aggregate characteristics (e.g., with respect to equity funds, market capitalization and industry weightings) to, the index or inverse of the index, or multiple thereof, as applicable. For example, a Fund may invest in or gain exposure to only a representative sample of the securities in the index, which exposure is intended to have aggregate characteristics similar to those of the index. Under certain circumstances, a Fund may invest in or obtain exposure to components not included in the index or overweight or underweight certain components of the index with the intent of obtaining exposure with aggregate characteristics similar to the index, including, as applicable, the general credit profile of the index. ProShare Advisors does not invest the assets of a Fund in securities or financial instruments based on ProShare Advisors' view of the investment merit of a particular security, instrument, or company, other than for cash management purposes, nor does it conduct conventional investment research or analysis (other than in determining counterparty creditworthiness), or forecast market movement or trends, in managing the assets of a Fund. Each Fund generally seeks to remain fully invested at all times in securities and/or financial instruments that, in combination, provide exposure to its index without regard to market conditions, trends, direction, or the financial condition of a particular issuer. In addition, for ProShares High Yield–Interest Rate Hedged and ProShares Investment Grade–Interest Rate Hedged, ProShare Advisors will rely solely on credit ratings provided by Moody's Investors Service, Inc. ("Moody's") and Standard & Poor's Financial Services, LLC ("S&P") in seeking to match the general credit profile of its index. To the extent the Fund is overweight in a security that is perceived by the markets to have increased credit risk, the Fund's performance will be adversely affected. The Funds do not take temporary defensive positions.

At the close of the U.S. securities markets on each trading day, each Short ProShares Fund and each Ultra ProShares Fund will seek to position its portfolio so that such Fund's exposure to its index is consistent with the Fund's investment objective. The movements of the Fund's index during the day will determine whether a Fund's portfolio needs to be repositioned. For example, if its index has risen on a given day, net assets of a Short ProShares Fund should fall. As a result, the Fund's short exposure will need to be decreased. Conversely, if the index has fallen on a given day, net assets of the Short ProShares Fund should rise. As a result, the Fund's short exposure will need to be increased. Similarly, if its index has risen on a given day, net assets of an Ultra

ProShares Fund should rise. As a result, the Fund's exposure will need to be increased. Conversely, if the index has fallen on a given day, net assets of the Ultra ProShares Fund should fall. As a result, the Fund's exposure will need to be decreased.

### Principal Investment Strategies Specific to the Actively Managed ProShares Funds

As described in its Summary Prospectus, each Actively Managed ProShares Fund invests in, as a principal investment strategy, credit default swaps ("CDS"). Cash balances arising from the use of derivatives will typically be held in very short-term money market instruments. The following principal investment strategies are applicable to the Actively Managed ProShares Funds as set forth below:

- **Derivatives** – ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF invest principally in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including exchange-traded funds ("ETFs")), interest rates or indexes. Each Fund primarily invests in derivatives to obtain long or inverse credit exposure to its stated geographic and credit quality focus. These derivatives principally include:
  - **Credit Default Swaps (CDS)** – ProShares CDS North American HY Credit ETF (the "Long Fund") and ProShares CDS Short North American HY Credit ETF (the "Short Fund") intend to primarily invest in centrally cleared, index-based CDS. CDS provide exposure to the credit of one or more debt issuers referred to as "reference entities." These instruments are designed to reflect changes in credit quality, including events of default. CDS are most commonly discussed in terms of buying or selling credit protection with respect to a reference entity. Selling credit protection is equivalent to being "long" credit. Because the Long Fund seeks to provide long exposure to credit, the Long Fund will generally be a net seller of credit protection with respect to debt issuers in the Fund's credit market. Buying credit protection is equivalent to being "short" credit. Because the Short Fund seeks to provide short exposure to credit, the Short Fund will generally be a net buyer of credit protection with respect to debt issuers in the Fund's credit market. Index-based CDS provide credit exposure, through a single trade, to a basket of reference entities. A variety of index-based CDS with different characteristics are currently available in the marketplace for each respective credit market with new issuances occurring periodically. Issuances typically vary in terms of underlying reference entities and maturity and, thus, can have significant differences in performance over time.
  - **Money Market Instruments** – ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF invest principally in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high credit profiles, including:
    - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.

- **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Funds as a short-term investment vehicle for cash positions.

The Funds seek to remain fully invested (i.e., will not take defensive positions). As such, the Long Fund should be expected to decrease in value when its credit market deteriorates. On the other hand, the Short Fund should be expected to decrease in value when its credit market improves.

Each Fund is subject to the Securities and Exchange Commission (“SEC”) “names rule” (Rule 35d-1 under the Investment Company Act of 1940 (the “1940 Act”), and will invest at least 80% of its net assets (i.e., net assets plus borrowings for investment purposes), under normal circumstances, in CDS that, in combination, should have economic characteristics that correlate to the credit market suggested by its name, or the inverse thereof. For these purposes, investments in centrally cleared, index-based CDS include not only the amounts associated with direct investments in the CDS but also cash and cash equivalents that are segregated on the Fund’s books and records or are being used as collateral or otherwise available to cover the investment exposure associated with the CDS.

### Principal Investment Strategies Specific to the Matching ProShares Funds

As described in its Summary Prospectus, each Matching ProShares Fund invests in, as a principal investment strategy, equity securities (ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares S&P MidCap 400 Dividend Aristocrats ETF, ProShares Russell 2000 Dividend Growers ETF, ProShares S&P 500 Dividend Aristocrats ETF and ProShares MSCI EAFE Dividend Growers ETF), a combination of equity securities and derivatives (ProShares Large Cap Core Plus, ProShares Merger ETF and ProShares RAFI™ Long/Short), a combination of equity securities, derivatives and depositary receipts (ProShares Hedge Replication ETF), a combination of fixed income securities and derivatives (ProShares High Yield–Interest Rate Hedged and ProShares Investment Grade–Interest Rate Hedged), fixed income securities (ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF and ProShares Short Term USD Emerging Markets Bond ETF), a combination of U.S. Treasury Securities and derivatives (ProShares 30 Year TIPS/TSY Spread), combination of equity securities, and derivatives (Hedged FTSE Europe ETF and Hedged FTSE Japan ETF) or a combination of ETFs (ProShares Morningstar Alternatives Solution ETF) that ProShare Advisors believes, in combination, should have similar return characteristics as the return of its index. Cash balances for ProShares High–Yield Interest Rate Hedged and ProShares Investment Grade–Interest Rate Hedged as well as cash balances arising from the use of derivatives or shorting securities will typically be held in money market instruments. A portion of these money market instruments may be posted as collateral in connection with the use of derivatives, if applicable. The following principal investment

strategies are applicable to the Matching ProShares Funds as set forth below:

- **Debt Securities** – ProShares USD Covered Bond invests principally in debt securities, primarily in debt instruments (“Covered Bonds”) that are issued by a financial institution and are secured by a segregated pool of financial assets, typically comprised of mortgages (e.g., residential, commercial and/or ship mortgages) or, in certain cases, public-sector loans, which are loans made to national, regional and local authorities to fund public-sector lending (e.g., loans that support public investment and infrastructure projects). In addition, the pool of financial assets may include cash or cash equivalents). ProShares German Sovereign/Sub-Sovereign ETF invests principally in debt securities, primarily issued by the Federal Republic of Germany (“Sovereigns”) as well as by local governments and debt guaranteed or issued by entities or agencies guaranteed by various German governments (“Sub-Sovereigns”). ProShares High Yield–Interest Rate Hedged invests principally in debt securities, primarily high yield bonds, that are issued by corporate issuers that are rated “below investment grade” by both Moody’s and S&P. Credit rating agencies evaluate issuers and assign ratings based on their opinions of the issuer’s ability to pay interest and principal as scheduled. Those issuers with a greater risk of default—not paying interest or principal in a timely manner—are rated below investment grade. Such debt securities may include Rule 144A securities, which generally are restricted securities that are only available to “qualified” investors. ProShares Investment Grade–Interest Rate Hedged invests principally in debt securities, primarily investment grade bonds, that are issued by corporate issuers that are rated “investment-grade” by both Moody’s and S&P. Credit rating agencies evaluate issuers and assign ratings based on their opinions of the issuer’s ability to pay interest and principal as scheduled. The bonds invested in by the Fund may include USD-denominated bonds issued by foreign-domiciled companies that are offered for sale in the United States. ProShares Short Term USD Emerging Markets Bond ETF invests principally in U.S. dollar-denominated debt securities issued by sovereign governments (Sovereigns), non-sovereign government agencies and entities (Sub-Sovereigns) or corporations with significant government ownership (Quasi-Sovereigns) deemed to be domiciled in “Emerging Markets” by the index provider that are offered for sale in the United States. Because the debt securities are U.S. dollar-denominated, fluctuations in currency exchange rates will not directly affect the principal or coupons associated with the debt securities.
- **Equity Securities** – ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares Large Cap Core Plus, ProShares S&P MidCap 400 Dividend Aristocrats ETF, ProShares Russell 2000 Dividend Growers ETF, ProShares S&P 500 Dividend Aristocrats ETF, ProShares MSCI EAFE Dividend Growers ETF, Hedged FTSE Europe ETF, Hedged FTSE Japan ETF, ProShares Hedge Replication ETF, ProShares Merger ETF and ProShares RAFI™ Long/Short invest principally in common stock issued by public companies. ProShares DJ Brookfield Global Infrastructure ETF invests

principally in common stock issued by U.S. and foreign public companies, including Master Limited Partnerships (“MLPs”), which are commonly taxed as partnerships and publicly traded on national securities exchanges. The Fund generally does not intend to invest more than 25% of its net assets in MLPs. ProShares Global Listed Private Equity ETF invests principally in common stock issued by U.S. and foreign public companies, including in large part business development companies (“BDCs”) for U.S. domiciled companies. BDCs are specialized investment vehicles that provide financing to small- and middle-market companies and offer managerial expertise, as needed, to assist those companies. ProShares Merger ETF invests principally in common stock issued by U.S. and foreign public companies. ProShares MSCI EAFE Dividend Growers ETF invests in the equity securities of companies domiciled in developed market countries, excluding the U.S. and Canada.

- **U.S. Treasury Securities** – ProShares 30 Year TIPS/TSY Spread has exposure to U.S. Treasury Inflation-Protected Securities and U.S. Treasury bonds as a principal investment strategy.
- **Derivatives** – ProShares Large Cap Core Plus, ProShares High Yield–Interest Rate Hedged, ProShares Investment Grade–Interest Rate Hedged, ProShares Hedge Replication ETF, ProShares Merger ETF, ProShares RAFI™ Long/Short and ProShares 30 Year TIPS/TSY Spread, Hedged FTSE Europe ETF and Hedged FTSE Japan ETF invest principally in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. ProShares High Yield–Interest Rate Hedged primarily invests in derivatives as a substitute for obtaining short exposure in U.S. Treasury notes or bonds (“Treasury Securities”) but may also do so to a limited extent to obtain high yield bond exposure. ProShares Investment Grade–Interest Rate Hedged primarily invests in derivatives as a substitute for obtaining short exposure in U.S. Treasury Securities but may also do so to a limited extent to obtain investment grade bond exposure. ProShares Large Cap Core Plus, ProShares Hedge Replication ETF, ProShares Merger ETF and ProShares RAFI™ Long/Short invest in derivatives as a substitute for investing directly in, or shorting, stocks or debt. ProShares Merger ETF may also invest in derivatives for effecting currency hedging transactions. ProShares 30 Year TIPS/TSY Spread invests in derivatives as a substitute for investing directly in or making short sales of the U.S. Treasury Securities underlying its index. These derivatives principally include:
  - **Swap Agreements** – ProShares Hedge Replication ETF, ProShares Large Cap Core Plus, ProShares Merger ETF, ProShares RAFI™ Long/Short and ProShares 30 Year TIPS/TSY Spread invest in, as a principal investment strategy, swap agreements, which are contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – ProShares High Yield–Interest Rate Hedged, ProShares Investment Grade–Interest Rate Hedged, ProShares Hedge Replication ETF and ProShares 30 Year TIPS/TSY Spread invest in, as a principal investment strategy, futures contracts, which are standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for cash settlement. ProShares High Yield–Interest Rate Hedged and ProShares Investment Grade–Interest Rate Hedged will use futures contracts to obtain short exposure to Treasury Securities.
  - **Forward Contracts** – ProShares Merger ETF, Hedged FTSE Europe ETF and Hedged FTSE Japan ETF invests in, as a principal investment strategy, forward contracts, which are two-party contracts where a purchase or sale of a specific quantity of a commodity, security, foreign currency or other financial instrument is entered into with dealers or financial institutions at a set price, with delivery and settlement at a specified future date. Forward contracts may also be structured for cash settlement, rather than physical delivery.
- **Money Market Instruments** – ProShares Hedge Replication ETF, ProShares Merger ETF, ProShares RAFI™ Long/Short, ProShares 30 Year TIPS/TSY Spread, ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF invest principally in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by a Fund as a short-term investment vehicle for cash positions.
- **Depository Receipts** – ProShares Hedge Replication ETF invests principally in depository receipts, which include:
  - **American Depositary Receipts (“ADRs”)**, which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - **Global Depositary Receipts (“GDRs”)**, which are receipts for shares in a foreign-based corporation traded in capital markets around the world.
- **Exchange-Traded Funds (ETFs)** – ProShares Morningstar Alternatives Solution ETF, Hedged FTSE Europe ETF and Hedged FTSE Japan ETF, invests in shares of other ETFs, which are listed, open-ended pooled investment entities that provide exposure to different asset classes and investment strategies.

Each Matching ProShares Fund subject to the Securities and Exchange Commission's "names rule" commits to invest at least 80% of its assets (i.e., net assets plus borrowings for investment purposes), under normal circumstances, in the types of securities suggested by its name and/or investments with similar economic characteristics. ProShares Morningstar Alternatives Solution ETF will, under normal circumstances, invest at least 80% of its total assets in Underlying ETFs. "Underlying ETFs" are ETFs, sponsored by the Advisor or its affiliates, in which ProShares Morningstar Alternatives Solution ETF invests. Under normal circumstances, ProShares High Yield–Interest Rate Hedged will invest at least 80% of its total assets in component securities (i.e., securities of its index) and invest at least 80% of its total assets in high yield bonds. Under normal circumstances, ProShares Investment Grade–Interest Rate Hedged will invest at least 80% of its total assets in component securities (i.e., securities of its index) and invest at least 80% of its total assets in investment grade bonds.

### Principal Investment Strategies Specific to Short ProShares Funds

As described in its Summary Prospectus, each Short ProShares Fund invests in, as a principal investment strategy, derivatives that ProShare Advisors believes should have similar daily return characteristics as the inverse (-1x) or inverse multiple (i.e., -2x or -3x) of the daily return of its index. Cash balances arising from the use of derivatives or shorting securities will typically be held in money market instruments. A portion of these money market instruments may be posted as collateral in connection with the use of derivatives. The following principal investment strategies are applicable to the Short ProShares Funds as set forth below:

- **Derivatives** – Each Short ProShares Fund invests principally in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. A Short ProShares Fund invests in derivatives as a substitute for shorting stocks or debt in order to gain inverse or inverse leveraged exposure to the index. These derivatives principally include:
  - **Swap Agreements** – Each Short ProShares Fund invests in, as a principal investment strategy, swap agreements, which are contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard "swap" transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or "swapped" between the parties is calculated with respect to a "notional amount," e.g., the return on or change in value of a particular dollar amount invested in a "basket" of securities or an ETF representing a particular index.
  - **Futures Contracts** – Each of ProShares Short S&P 500<sup>®</sup>, ProShares Short QQQ<sup>®</sup>, ProShares Short Dow30<sup>SM</sup>, ProShares Short MidCap400, ProShares Short Russell2000, ProShares UltraShort S&P500<sup>®</sup>, ProShares UltraShort QQQ<sup>®</sup>, ProShares

UltraShort Dow30<sup>SM</sup>, ProShares UltraShort MidCap400, ProShares UltraShort Russell2000, ProShares UltraPro Short S&P500<sup>®</sup>, ProShares UltraPro Short QQQ<sup>®</sup>, ProShares UltraPro Short Dow30<sup>SM</sup>, ProShares UltraPro Short MidCap400, ProShares UltraPro Short Russell2000, ProShares Short 7-10 Year Treasury, ProShares Short 20+ Year Treasury, ProShares UltraShort 7-10 Year Treasury, ProShares UltraShort 20+ Year Treasury and ProShares UltraPro Short 20+ Year Treasury, invests in, as a principal investment strategy, futures contracts, which are standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for a cash settlement.

- **Money Market Instruments** – The Short ProShares Funds invest principally in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
  - **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by a Fund as a short-term investment vehicle for cash positions.

Each Short ProShares Fund subject to the SEC "names rule" commits to invest at least 80% of its assets (i.e., net assets plus borrowings for investment purposes), under normal circumstances, in the types of securities suggested by its name and/or investments with similar economic characteristics.

### Principal Investment Strategies Specific to Ultra ProShares Funds

As described in its Summary Prospectus, each Ultra ProShares Fund invests in, as a principal investment strategy, U.S. Government debt securities, equity securities and/or derivatives that ProShare Advisors believes, in combination, should have similar daily return characteristics as a multiple (i.e., 2x or 3x) of the daily return of its index. Cash balances arising from the use of derivatives will typically be held in money market instruments. A portion of these money market instruments may be posted as collateral in connection with the use of derivatives. The following principal investment strategies are applicable to the Ultra ProShares Funds as set forth below:

- **U.S. Government Debt Securities** – ProShares Ultra 7-10 Year Treasury and ProShares Ultra 20+ Year Treasury invest in U.S. government securities, which are issued by the U.S. government or one of its agencies or instrumentalities, including U.S. Treasury securities. Some, but not all U.S. government securities are backed by the full faith and credit of the federal government. Other U.S. government securities are backed by the issuer's right to borrow from the U.S. Treasury and some are backed only by the credit of the issuing organization.

- **Equity Securities** – Each Ultra ProShares Fund currently invests in common stock issued by public companies as a principal investment strategy, except ProShares Ultra Gold Miners, ProShares Ultra Junior Miners, ProShares Ultra 7-10 Year Treasury, ProShares Ultra 20+ Year Treasury, UltraShort Homebuilders & Supplies, UltraShort Oil & Gas Exploration & Production, UltraPro Short Nasdaq Biotechnology, Ultra Homebuilders & Supplies, Ultra Oil & Gas Exploration & Production, and UltraPro Nasdaq Biotechnology.
- **Exchange-traded Funds (ETFs)** – ProShares Ultra Gold Miners, ProShares Ultra Junior Miners, ProShares Ultra High Yield and ProShares Ultra Investment Grade Corporate invest principally in shares of other ETFs, which are registered investment companies that are traded on stock exchanges and hold assets such as stocks and bonds.
- **Derivatives** – Each Ultra ProShares Fund invests principally in derivatives, which are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes as a principal investment strategy. An Ultra ProShares Fund invests in derivatives as a substitute for investing directly in stocks or debt in order to gain leveraged exposure to the Fund's index. These derivatives principally include:
  - **Swap Agreements** – Each Ultra ProShares Fund invests in, as a principal investment strategy, swap agreements, which are contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the returns (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Each of ProShares Ultra S&P500<sup>®</sup>, ProShares Ultra QQQ<sup>®</sup>, ProShares Ultra Dow30<sup>SM</sup>, ProShares Ultra MidCap400, ProShares Ultra Russell2000, ProShares UltraPro S&P500<sup>®</sup>, ProShares UltraPro QQQ<sup>®</sup>, ProShares UltraPro Dow30<sup>SM</sup>, ProShares UltraPro MidCap400, ProShares UltraPro Russell2000, ProShares Ultra 7-10 Year Treasury and ProShares Ultra 20+ Year Treasury invests in, as a principal investment strategy, futures contracts, which are standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for a cash settlement.
- **Money Market Instruments** – The Ultra ProShares Funds invest principally in short-term cash instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles, including:
  - **U.S. Treasury Bills** – U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.

- **Repurchase Agreements** – Contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Fund as a short-term investment vehicle for cash positions.

- **Depository Receipts** – ProShares Ultra MSCI EAFE, ProShares Ultra MSCI Emerging Markets, ProShares Ultra FTSE Europe, ProShares Ultra MSCI Pacific ex-Japan, ProShares Ultra MSCI Brazil Capped, ProShares Ultra FTSE China 50, ProShares Ultra MSCI Japan and ProShares Ultra MSCI Mexico Capped IMI invest principally in depository receipts, which include:
  - American Depositary Receipts (ADRs), which represent the right to receive securities of foreign issuers deposited in a bank or trust company.
  - Global Depositary Receipts (GDRs), which are receipts for shares in a foreign-based corporation traded in capital markets around the world.

Each Ultra ProShares Fund subject to the SEC's “names rule” commits to invest at least 80% of its assets (i.e., net assets plus borrowings for investment purposes), under normal circumstances, in the types of securities suggested by its name and/or investments with similar economic characteristics.

### Principal Risks of Geared Funds and the Impact of Compounding

Like all investments, investing in the Funds entails risks. The factors most likely to have a significant impact on a Fund's portfolio are called “principal risks.” The principal risks for each Fund are described in each Fund's Summary Prospectus Section and additional information regarding certain of these risks, as well as information related to other potential risks to which the Funds may be subjected, is provided below. Some risks apply to all Funds, while others are specific to the investment strategies of certain Funds, as indicated below. The Statement of Additional Information (“SAI”) contains additional information about the Funds, their investment strategies and related risks. Each Fund may be subject to other risks in addition to those identified as principal risks. This section discusses the risks of leverage and explains what factors impact the performance of Geared Funds with single day investment objectives.

- **Leverage Risk** – *(All Funds, except Actively Managed ProShares Funds, Matching ProShares Funds and Short (-1x) ProShares Funds)* The Funds utilize leverage (i.e., obtain investment exposure in excess of their assets) in seeking to achieve their investment objective and will lose more money in market environments adverse to their daily objective than similar funds that do not employ leverage. Because certain Funds include either a 3x or -3x or a 2x or -2x multiplier, a single day adverse price movement of more than 33% (in the case of UltraPro or UltraPro Short ProShares Funds) or 50% (in the case of Ultra or UltraShort ProShares Funds) in a relevant index, could result in the total loss of an investor's investment.
- **Compounding Risk for Index Funds** – *(All Funds except Actively Managed ProShares Funds and Matching ProShares Funds)*

Most of the Funds are “Geared” Funds (each a “Geared Fund,” and collectively the “Geared Funds”) in that each has an investment objective to match a multiple, the inverse or a multiple of the inverse of the performance of an index on a single day. A “single day” is measured from the time a Fund calculates its net asset value (NAV) to the time of the Fund’s next NAV calculation. These Funds are subject to all of the correlation risks described below. In addition, because the Funds have a single day investment objective, for periods greater than a single day, the effect of compounding may cause the performance of a Fund to be either better or worse than the index performance (or the inverse of the index performance over the period) times the stated multiple in the Fund’s investment objective, as applicable, before accounting for fees and Fund expenses. As explained in greater detail in the following section, as a result of compounding, Geared Funds are unlikely to provide a simple multiple (e.g., -1x, -2x, 3x or -3x) of an index’s return over periods longer than a single day.

### Understanding Long-Term Performance of Daily Objective Funds — the Impact of Compounding

The Short and Ultra ProShares Funds, are designed to provide leveraged (i.e., 2x or 3x), inverse (i.e., -1x) or inverse leveraged (i.e., -2x or -3x) results on a daily basis. The Funds, however, are unlikely to provide a simple multiple (i.e., -1x, 2x, -2x, 3x or -3x) of an index’s performance over periods longer than a single day.

- **Why?** The hypothetical example below illustrates how daily Geared Fund returns can behave for periods longer than a single day.

Take a hypothetical fund XYZ that seeks to triple the daily performance of index XYZ. On each day, fund XYZ performs in line with its objective (3x the index’s daily performance before fees and expenses). Notice that over the entire five-day period, the fund’s total return is considerably less than three times that of the period return of the index. For the five-day period, index XYZ gained 5.1% while fund XYZ gained 14.2% (versus  $3 \times 5.1\%$  or 15.3%). In other scenarios, the return of a daily rebalanced fund could be greater than three times the index’s return.

	Index XYZ		Fund XYZ	
	Level	Daily Performance	Daily Performance	Net Asset Value
Start	100.0			\$100.00
Day 1	103.0	3.0%	9.0%	\$109.00
Day 2	99.9	-3.0%	-9.0%	\$99.19
Day 3	103.9	4.0%	12.0%	\$111.09
Day 4	101.3	-2.5%	-7.5%	\$102.76
Day 5	105.1	3.7%	11.1%	\$114.17
Total Return	5.1%			14.2%

- **Why does this happen?** This effect is caused by compounding, which exists in all investments, but has a more significant impact on a Geared Fund. In general, during periods of higher index volatility, compounding will cause longer term results to be more or less than the multiple of the return of the index.

This effect becomes more pronounced as volatility increases. Conversely, in periods of lower index volatility (particularly when combined with higher index returns), fund returns over longer periods can be higher than the multiple of the return of the index. Actual results for a particular period, before fees and expenses, are also dependent on the following factors: a) the index’s volatility; b) the index’s performance; c) period of time; d) financing rates associated with derivatives; e) other Fund expenses; and f) dividends or interest paid with respect to the securities in the index. The examples herein illustrate the impact of two principal factors—index volatility and index performance—on Fund performance. Similar effects exist for the Short ProShares Funds, and the significance of this effect is even greater for such inverse funds. Please see the SAI for additional details.

The graphs that follow illustrate this point. Each of the graphs shows a simulated hypothetical one year performance of an index compared with the performance of a fund that perfectly achieves its investment objective. The graphs demonstrate that, for periods greater than a single day, a Geared Fund is likely to underperform or overperform (but not match) the index performance (or the inverse of the index performance) times the stated multiple in the fund’s investment objective. Investors should understand the consequences of holding daily rebalanced funds for periods longer than a single day and should actively manage and monitor their investments, as frequently as daily. A one-year period is used for illustrative purposes only. Deviations from the index return times the fund multiple can occur over periods as short as two days (each day as measured from one day’s NAV to the next day’s NAV) and may also occur in periods shorter than a single day (when measured intraday as opposed to NAV to NAV).

### For UltraPro (3x) and UltraPro Short (-3x) ProShares Funds

To isolate the impact of leverage or inverse leveraged exposure, these graphs assume: a) no dividends paid with respect to securities in the index; b) no Fund expenses; and c) borrowing/lending rates (to obtain required leverage or inverse leveraged exposure) of zero percent. If these were reflected, the Fund’s performance would be different than that shown. Each of the graphs also assumes a volatility rate of 17%, which is the approximate average of the five-year historical volatility rate of the S&P 500®, S&P MidCap 400®, Russell 2000 Index®, NASDAQ-100 Index® and Dow Jones Industrial Average<sup>SM</sup>. An index’s volatility rate is a statistical measure of the magnitude of fluctuations in the returns of an index. Other indexes to which the Funds are benchmarked have different historical volatility rates; certain of the Funds’ historical volatility rates are substantially in excess of 17%.

**One-Year Simulation; Index Flat (0%)  
(Annualized Index Volatility 17%)**

This graph shows a scenario where the index, which exhibits day-to-day volatility, is flat or trendless over the year (i.e., begins and ends the year at 0%), but the UltraPro ProShares (+3x) Fund and the UltraPro Short ProShares (-3x) Fund are both down.

**One-Year Simulation; Index Up 14%  
(Annualized Index Volatility 17%)**

This graph shows a scenario where the index, which exhibits day-to-day volatility, is up over the year, but the UltraPro ProShares (+3x) Fund is up less than three times the index and the UltraPro Short ProShares (-3x) Fund is down more than three times the inverse of the index.

**One-Year Simulation; Index Down 14%  
(Annualized Index Volatility 17%)**

This graph shows a scenario where the index, which exhibits day to day volatility, is down over the year, the UltraPro ProShares (+3x) Fund is down less than three times the index, and the UltraPro Short ProShares (-3x) Fund is up less than three times the inverse of the index.

#### For Ultra (2x) and UltraShort (-2x) ProShares Funds

To isolate the impact of leverage or inverse leveraged exposure, these graphs assume: a) no dividends paid with respect to securities in the index; b) no Fund expenses; and c) borrowing/lending rates (to obtain required leverage or inverse leveraged exposure) of zero percent. If these were reflected, the Fund's performance would be different than that shown. Each of the graphs also assumes a volatility rate of 17%, which is an approximate average of the five-year historical volatility rate of the S&P 500<sup>®</sup>, S&P MidCap 400<sup>®</sup>, Russell 2000<sup>®</sup> Index, NASDAQ-100 Index<sup>®</sup> and Dow Jones Industrial Average<sup>™</sup>. An index's volatility rate is a statistical measure of the magnitude of fluctuations in the returns of an index. Other indexes to which the Funds are benchmarked have different historical volatility rates; certain of the Funds' historical volatility rates are substantially in excess of 17%.

**One-Year Simulation; Index Flat (0%)  
(Annualized Index Volatility 17%)**

This graph shows a scenario where the index, which exhibits day-to-day volatility, is flat or trendless over the year (i.e., begins and ends the year at 0%), but the Ultra ProShares (+2x) Fund and the UltraShort ProShares (-2x) Fund are both down.

This graph shows a scenario where the index, which exhibits day-to-day volatility, is up over the year, but the Ultra ProShares (+2x) Fund is up less than two times the index and the UltraShort ProShares (-2x) Fund is down more than two times the inverse of the index.

This graph shows a scenario where the index, which exhibits day-to-day volatility, is down over the year, the Ultra ProShares (+2x) Fund is down more than two times the Index, and the UltraShort ProShares (-2x) Fund is up less than two times the inverse of the index.

## For Short (-1x) ProShares Funds

To isolate the impact of inverse exposure, these graphs assume: a) no dividends paid with respect to securities in the index; b) no Fund expenses; and c) borrowing/lending rates (to obtain required inverse exposure) of zero percent. If these were reflected, the Fund's performance would be different than that shown. Each of the graphs also assume a volatility rate of 17%, which is an approximate average of the five-year historical volatility rate of the S&P 500<sup>®</sup>, S&P MidCap 400<sup>®</sup>, Russell 2000 Index<sup>®</sup>, NASDAQ-100<sup>®</sup> Index and Dow Jones Industrial Average<sup>™</sup>. An index's volatility rate is a statistical measure of the magnitude of fluctuations in the return of an index. Other indexes to which the Funds are benchmarked have different historical volatility rates; certain of the Funds' historical volatility rates are substantially in excess of 17%.

This graph shows a scenario where the index, which exhibits day to day volatility, is flat or trendless over the year (i.e., begins and ends the year at 0%), but the Short ProShares (-1x) Fund is down.

This graph shows a scenario where the index, which exhibits day to day volatility, is up over the year, and the Short ProShares (-1x) Fund is down more than the inverse of the index.

This graph shows a scenario where the index, which exhibits day-to-day volatility, is down over the year, and the Short ProShares (-1x) Fund is up less than the inverse of the index.

The table below shows the historical annualized volatility rate for the five-year period ended June 30, 2015 of the relevant Funds' indices.

Index	Historical Five-Year Annualized Volatility Rate
Barclays Capital U.S. 20+ Year Treasury Bond Index	14.97%
Barclays Capital U.S. 3-7 Year Treasury Bond Index	3.34%
Barclays Capital U.S. 7-10 Year Treasury Bond Index	6.36% *
Barclays Capital U.S. Treasury Inflation Protected Securities (TIPS) Index	5.57%
BNP Paribas Solactive Diversified USD Covered Bond Index	1.51%
Market CDX North American HY Credit Index	7.59%
Citi High-Yield (Treasury-Rate Hedged) Index	5.73%
Credit Suisse 10-Year Inflation Breakeven Index	4.50%

Short Term USD Emerging Markets Bond	2.74%
NYSE Arca Gold Miners Index	34.80%
Market Vectors Global Junior Gold Miners Index	39.02%

\* Each of these indexes has less than five years of performance. Thus, the annualized volatility rate is computed as of the first date that such index's performance became available on Bloomberg: BNP Paribas Solactive Diversified USD Covered Bond Index (July 29, 2011); Markit iBoxx® EVR Germany Sovereign & Sub-Sovereign Liquid Index (December 20, 2011); MSCI Brazil 25/50 Index (November 21, 2012); MSCI EAFE Dividend Masters Index (August 5, 2014); and MSCI Mexico IMI 25/50 Index (November 21, 2012).

\*\* Prior to September 22, 2014, the FTSE China 50 consisted of 25 stocks and was called the FTSE China 25. On September 22, the index began a migration from a 25-stock index to a 50-stock index. The index completed its allocation to the additional securities in three periodic reviews ending November 24, 2014.

For additional details about fund performance over periods longer than a single day in both Ultra and Short ProShares Funds, please see the SAI.

- What it means to you

Daily objective Geared Funds, if used properly and in conjunction with the investor's view on the future direction and volatility of the markets, can be useful tools for investors who want to manage their exposure to various markets and market segments and who are willing to monitor and/or periodically rebalance their portfolios (which will possibly trigger transaction costs and tax consequences). However, investors considering these Funds should understand that they are designed to provide a positive or negative multiple of an index on a daily basis and not for greater periods of time. As a result, Fund returns will likely not be a simple multiple (e.g., 3x, -3x) or inverse (-1x) of an index's return for time periods longer than a single day.

Additionally, investors should recognize that the degree of volatility of a Fund's index can have a dramatic effect on a Fund's longer-term performance. The more volatile an index is, the more a Fund's longer-term performance will negatively deviate from a simple multiple (e.g., 3x, -3x) or inverse (-1x) of its index's longer-term return. It is even possible that over periods longer than a single day a fund's performance may move in a different direction than the index's performance.

- **Compounding Risk for Actively Managed Funds** (*ProShares CDS Short North American HY Credit ETF*) – In the course of managing the Fund's investments, ProShare Advisors will periodically adjust the Fund's holdings in order to maintain investment exposure approximately equivalent to the Fund's assets. This process entails obtaining additional exposure when the Fund experiences gains, and reducing exposure when the Fund experiences losses. If the credit market subsequently reverses direction following such an adjustment, there will be a negative impact on the Fund's performance. Higher volatility in the credit market will adversely affect the Fund's performance.

## Other Principal Risks

In addition to the risks noted above, many other factors may also affect the value of an investment in a Fund. A Fund's NAV should change daily relative to the performance of its index, which in turn is affected by variations in market conditions, interest rates and other economic, political or financial developments. The impact of these developments on a Fund will depend upon the types of investments in which the Fund invests, the Fund's level of investment in particular issuers and other factors, including the financial condition, industry, economic sector and location of such issuers. The SAI contains additional information about each Fund, its investment strategies and related risks. Each Fund may be subject to other risks in addition to those identified as principal risks.

While the realization of certain of these risks may benefit the Short ProShares Funds (including the Short (-1x), UltraShort (-2x) and UltraPro Short (-3x) ProShares Funds) because these Funds seek investment results that correspond to the inverse or a multiple of the inverse of their respective Index, such occurrences may introduce more volatility to these Funds.

- **Risks Associated with the Use of Derivatives** (*All Funds, except ProShares Morningstar Alternatives Solution ETF, ProShares*

*DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares S&P MidCap 400 Dividend Aristocrats ETF, ProShares Russell 2000 Dividend Growers ETF, ProShares S&P 500 Dividend Aristocrats ETF, ProShares MSCI EAFE Dividend Growers ETF, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF and ProShares Short Term USD Emerging Markets Bond ETF*) – Each Fund obtains investment exposure through derivatives (including investing in: swap agreements; futures contracts; options on futures contracts; securities and indexes; forward contracts; and similar instruments). Investing in derivatives may be considered aggressive and may expose a Fund to risks different from, or possibly greater than, the risks associated with investing directly in the reference asset(s) underlying the derivative (e.g., the securities contained in a Fund's index), including: 1) the risk that there may be imperfect correlation between the price of the financial instruments and movements in the prices of the reference asset(s); 2) the risk that an instrument is mispriced; 3) credit or counterparty risk on the amount each Fund expects to receive from a counterparty; 4) the risk that securities prices, interest rates and currency markets will move adversely and a Fund will incur significant losses; 5) the risk that the cost of holding a financial instrument might exceed its total return; and 6) the possible absence of a liquid secondary market for a particular instrument and possible exchange-imposed price fluctuation limits, either of which may make it difficult or impossible to adjust a Fund's position in a particular instrument when desired. When a Fund uses derivatives, there may be imperfect correlation between the value of the reference asset(s) underlying the derivative (e.g., the securities in the index) and the derivative, which may prevent the Fund from achieving its investment objective. Because derivatives often require limited initial investment, the use of derivatives also may expose the Fund to losses in excess of those amounts initially invested.

In addition, a Fund may use a combination of swaps on an underlying index and swaps on an ETF that is designed to track the performance of that index. The performance of an ETF may not track the performance of its underlying index due to embedded costs and other factors. Thus, to the extent the Fund invests in swaps that use an ETF as the reference asset, the Fund may be subject to greater correlation risk and may not achieve as high a degree of correlation with its index as it would if the Fund only used swaps on the underlying index.

Moreover, with respect to the use of swap agreements, if an index has a dramatic intraday move that causes a material decline in a Fund's net assets, the terms of a swap agreement between the Fund and its counterparty may permit the counterparty to immediately close out the transaction with the Fund. In that event, the Fund may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with the Fund's investment objective. This, in turn, may prevent the Fund from achieving its investment objective, even if the index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives will also have the effect of lowering the Fund's return.

- **Active Management Risk** (*ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF*) – The performance of actively managed funds reflect, in part, the ability of ProShare Advisors to select investments and make investment decisions that are suited to achieving a Fund’s investment objectives. ProShare Advisors’ judgments about a Fund’s investments may prove to be incorrect. If the investments selected and strategies employed by a Fund fail to produce the intended results, the Fund could underperform other funds with a similar investment objective and/or strategies.
- **Benchmark/Index Performance Risk** (*ProShares Morningstar Alternatives Solution ETF*) – There is no guarantee or assurance that the methodology used to create the Index, or a benchmark or index for a particular Underlying ETF, will result in the Fund or an Underlying ETF, as applicable, achieving high, or even positive, returns. The Index or benchmark for a particular Underlying ETF may underperform more traditional indices. In turn, the Fund or an Underlying ETF could lose value while the levels of other indices or measures of market performance increase.

In addition, the Merrill Lynch Factor Model – Exchange Series, the benchmark for ProShares Hedge Replication ETF (an Underlying ETF), does not in any way represent a managed hedge fund or group of hedge funds, and there is no guarantee that it will achieve returns correlated with any hedge fund, group of hedge funds, or the HFRI Fund Weighted Composite Index (the “HFRI”) (an index that the Merrill Lynch Factor Model-Exchange Series is designed to correlate to). Neither ProShare Advisors nor Merrill Lynch International has any control over the composition or compilation of the HFRI, and there is no guarantee that the HFRI will continue to be produced.

- **Correlation Risk** (*All Index Funds*) – There is no guarantee that a Fund (or an Underlying ETF in the case of ProShares Morningstar Alternatives Solution ETF) will achieve a high degree of correlation with its index. Failure to achieve a high degree of correlation may prevent a Fund from achieving its investment objective, and the percentage change of the Fund’s NAV each day may differ, perhaps significantly, from the percentage change of the Fund’s index on such day. This may be due, among other reasons, to the impact of a limited trading market in the underlying component securities on the calculation of the index. A number of other factors may also adversely affect a Fund’s correlation with its index, including material over- or underexposure, fees, expenses, transaction costs, financing costs associated with the use of derivatives, income items, valuation methodology, infrequent trading in the securities underlying its index, accounting standards and disruptions or illiquidity in the markets for the securities or financial instruments in which a Fund invests. While the Fund attempts to track the performance of the Index by investing all, or substantially all, of its assets in the securities that make up the Index in approximately the same proportion as their weighting in the Index, at times a Fund may not have investment exposure to all securities in its index, or its weighting of

investment exposure to such securities, financial investments or industries may be different from that of the index. In addition, a Fund may invest in securities or financial investments not included in the Fund’s index or in financial instruments. Each Fund may take or refrain from taking positions in order to improve tax efficiency or comply with regulatory restrictions, either of which may negatively affect the Fund’s correlation with its index. A Fund may also be subject to large movements of assets into and out of the Fund, potentially resulting in the Fund being over- or underexposed to its index and may be impacted by index reconstitutions and index rebalancing events. Additionally, a Fund’s underlying investments may trade on markets that may not be open on the same day as the Fund. Furthermore, a Fund’s currency holdings may be valued at a different time than the level of its index. In addition, the Fund’s foreign currency hedging strategy may also be unable to perfectly match the Index and will introduce additional costs, both sources of additional correlation risk. Any of these factors could decrease correlation between the performance of a Fund and the index and may hinder a Fund’s ability to meet its investment objective. For ProShares Merger ETF, the Fund’s foreign currency hedging strategy may also be unable to perfectly match its index and will introduce additional costs, both sources of additional correlation risk.

Furthermore, the percentage change of the NAV of ProShares Ultra and Short High Yield and ProShares Ultra and Short Investment Grade Corporate each day may differ, perhaps significantly, from two times (2x) the percentage of the change of the respective Fund’s index on such day or its inverse (-1x), as applicable. This is due primarily to: (a) the impact of a limited trading market in the component index bonds on the calculation of the relevant index; and (b) the time difference in calculation of the relevant index (3:00 p.m. Eastern Time) and valuation of the Fund (4:00 p.m. Eastern Time). As such, correlation to those indexes will generally be measured by comparing the daily change in a Fund’s NAV per share to the performance of one or more U.S. exchange-traded securities or financial instruments that reflect the values of the securities underlying the index as of the Fund’s NAV calculation time.

- **Counterparty Risk** (*All Funds except ProShares Morningstar Alternatives Solution ETF, ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares S&P MidCap 400 Dividend Aristocrats ETF, ProShares Russell 2000 Dividend Growers ETF, ProShares S&P 500 Dividend Aristocrats ETF, ProShares MSCI EAFE Dividend Growers ETF, ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF and ProShares Short Term USD Emerging Markets Bond ETF*) – A Fund will be subject to credit risk (i.e., the risk that a counterparty is unwilling or unable to make timely payments to meet its contractual obligations) with respect to the amount the Fund expects to receive from counterparties to financial instruments and repurchase agreements entered into by the Fund. The Funds generally structure the agreements such that either party can terminate

the contract without penalty prior to the termination date. A Fund may be negatively impacted if a counterparty becomes bankrupt or otherwise fails to perform its obligations under such an agreement. A Fund may experience significant delays in obtaining any recovery in a bankruptcy or other reorganization proceeding and a Fund may obtain only limited recovery or may obtain no recovery in such circumstances. The Funds typically enter into transactions with counterparties whose credit rating, at the time of the transaction, is investment grade, as determined by a nationally recognized statistical rating organization, or, if unrated, judged by ProShare Advisors to be of comparable quality. These are usually only major, global financial institutions. The Funds seek to mitigate risks by generally requiring that the counterparties for each Fund agree to post collateral for the benefit of the Fund, marked to market daily, in an amount approximately equal to what the counterparty owes the Fund, subject to certain minimum thresholds. To the extent any such collateral is insufficient or there are delays in accessing the collateral, the Funds will be exposed to the risks described above, including possible delays in recovering amounts as a result of bankruptcy proceedings. Although the counterparty to a centrally cleared swap agreement and/or exchange-traded futures contract is often backed by a futures commission merchant ("FCM") or clearing organization that is further backed by a group of financial institutions, there may be instances in which the FCM or the clearing organization could fail to perform its obligations, causing significant losses to the Fund. For example, a Fund could lose margin payments it has deposited with a clearing organization as well as any gains owed but not paid to the Fund, if the clearing organization becomes insolvent or otherwise fails to perform its obligations. Under current Commodity Futures Trading Commission ("CFTC") regulations, a FCM maintains customers' assets in a bulk segregated account. If a FCM fails to do so, or is unable to satisfy a substantial deficit in a customer account, its other customers may be subject to risk of loss of their funds in the event of that FCM's bankruptcy. In that event, in the case of futures and options on futures, the FCM's customers are entitled to recover, even in respect of property specifically traceable to them, only a proportional share of all property available for distribution to all of that FCM's customers.

- **Commodity and Currency Risk** (*ProShares Morningstar Alternatives Solution ETF*) – Investments linked to commodity or currency futures contracts can be highly volatile compared to investments in traditional securities and funds holding instruments linked to commodity or currency futures contracts may experience large losses. The value of instruments linked to commodity or currency futures contracts may be affected by changes in overall market movements, commodity or currency benchmarks (as the case may be), volatility, changes in interest rates, or factors affecting a particular industry, commodity or currency. For example, commodity futures contracts may be affected by numerous factors, including drought, floods, fires, weather, livestock disease, pipeline ruptures or spills, embargoes, tariffs and international, economic, political or

regulatory developments. In particular, trading in natural gas futures contracts (or other financial instruments linked to natural gas) has been very volatile and can be expected to be very volatile in the future. High volatility may have an adverse impact on certain Underlying ETFs beyond the impact of any performance-based losses of the underlying indexes.

- **Credit Default Swap (CDS) Risk** (*ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF*) – The Long Fund will normally be a net seller of credit protection on its stated geographic and credit quality-focused credit market through index-based CDS. The Short Fund will normally be a net buyer of credit protection on its stated geographic and credit quality-focused credit market through index-based CDS. Upon the occurrence of a credit event, the seller of credit protection will have an obligation to pay the full notional value of a defaulted reference entity less recovery value. Recovery values for CDS are generally determined via an auction process to determine the final price for a given reference entity. Although the Funds intend, as practicable, to obtain exposure through centrally cleared CDS, an active market may not exist for any of the CDS in which a Fund invests or in the reference entities subject to the CDS. As a result, a Fund's ability to maximize returns or minimize losses on such CDS may be impaired. Other risks of CDS include difficulty in valuation due to the lack of pricing transparency and the risk that changes in the value of the CDS do not reflect changes in the credit quality of the underlying reference entities or may otherwise perform differently than expected given market conditions. Because a Fund may use a single counterparty or a small number of counterparties, certain CDS involve many reference entities and there are no limitations on the notional amount established for the CDS. As a result, counterparty risk may be amplified.
- **Debt Instrument Risk** (*ProShares Morningstar Alternatives Solution ETF, ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF, ProShares Short Term USD Emerging Markets Bond ETF, ProShares Hedge Replication ETF, ProShares 30 Year TIPS/TSY Spread, ProShares Short 7-10 Year Treasury, ProShares Short 20+ Year Treasury, ProShares Short High Yield, ProShares Short Investment Grade Corporate, ProShares UltraShort 3-7 Year Treasury, ProShares UltraShort 7-10 Year Treasury, ProShares UltraShort 20+ Year Treasury, ProShares UltraShort TIPS, ProShares UltraPro Short 20+ Year Treasury, ProShares Ultra 7-10 Year Treasury, ProShares Ultra 20+ Year Treasury, ProShares Ultra High Yield and ProShares Ultra Investment Grade Corporate*) – Certain Funds invest in, or seek exposure to, debt instruments. Debt instruments may have varying levels of sensitivity to changes in interest rates and other factors. Typically, the prices of outstanding debt instruments fall when interest rates rise. Without taking into account other factors, the prices of debt instruments with longer maturities may fluctuate more in response to interest rate changes than those of debt instruments with shorter maturities. For ProShares High Yield-Interest Rate Hedged

and ProShares Investment Grade-Interest Rate Hedged, this could result in disproportionately larger losses in the short Treasury positions as compared to gains in the long high yield bond position attributable to interest rate changes in certain falling interest rate environments. In addition, changes in the credit quality of the issuer of a debt instrument (including a default) can also affect the price of a debt instrument. Many types of debt instruments are subject to prepayment risk, which is the risk that the issuer of the security will repay principal (in part or in whole) prior to the maturity date. Debt instruments allowing prepayment may offer less potential for gains during a period of declining interest rates, as a Fund may be required to reinvest the proceeds received at lower interest rates. Callable bonds may also have lower sensitivity to interest rate declines than non-callable bonds or Treasury securities. These factors may cause the value of an investment in the Fund to change. Also, the securities of certain U.S. government agencies, authorities or instrumentalities are neither issued by nor guaranteed as to principal and interest by the U.S. government, and may be exposed to more credit risk than securities issued by and guaranteed as to principal and interest by the U.S. government. All U.S. government securities are subject to credit risk. It is possible that the U.S. government may not be able to meet its financial obligations or that securities issued by the U.S. government may experience credit downgrades. Such a credit event may also adversely impact the financial markets.

Unlike conventional bonds, the principal or interest of inflation-linked securities, such as TIPS, is adjusted periodically to a specified rate of inflation. There can be no assurance that the inflation index used will accurately measure the real rate of inflation. These securities may lose value in the event that the actual rate of inflation is different than the rate of the inflation index.

High-yield, fixed income securities are considered to be speculative and may have a greater risk of default than other types of debt instruments.

- **Financial Services Industry Risk** – ProShares Global Listed Private Equity ETF, an Underlying ETF, is subject to risks faced by companies in the financial services economic sector to the same extent as its index is so concentrated, including: extensive governmental regulation and/or nationalization that affects the scope of their activities, the prices they can charge and the amount of capital they must maintain; adverse effects from increases in interest rates; effects on profitability by loan losses, which usually increase in economic downturns; the severe competition to which banks, insurance, and financial services companies may be subject; and increased inter-industry consolidation and competition in the financial sector.
- **Fixed Income and Market Risk** – The TIPS and U.S. Treasury markets can be volatile, and the value of securities, swaps, futures, options contracts and other instruments correlated with these markets may fluctuate dramatically from day-to-day. Fixed income markets are subject to adverse issuer, political, regulatory, market and economic developments, as well as

developments that impact specific economic sectors, industries or segments of the market. Further, fixed income securities in the Index may underperform other fixed income or inflation-linked investments. Equity securities generally have greater price volatility than fixed income securities, although under certain market conditions fixed income securities may have comparable or greater price volatility. Volatility in the markets and/or market developments may cause the value of an investment in certain Underlying ETFs to decrease

- **Foreign Investments Risk/Exposure to Foreign Investments Risk** (*ProShares Morningstar Alternatives Solution ETF, ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares MSCI EAFE Dividend Growers ETF, Hedged FTSE Europe ETF, Hedged FTSE Japan ETF, ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF, ProShares Short Term USD Emerging Markets Bond ETF, ProShares Hedge Replication ETF, ProShares Merger ETF, ProShares UltraShort Nasdaq Biotechnology, ProShares UltraPro Short Nasdaq Biotechnology, ProShares Short MSCI EAFE, ProShares Short MSCI Emerging Markets, ProShares Short FTSE China 50, ProShares UltraShort MSCI EAFE, ProShares UltraShort MSCI Emerging Markets, ProShares UltraShort FTSE Europe, ProShares UltraShort MSCI Pacific ex-Japan, ProShares UltraShort MSCI Brazil Capped, ProShares UltraShort FTSE China 50, ProShares UltraShort MSCI Japan, ProShares UltraShort MSCI Mexico Capped IMI, ProShares Short High Yield, ProShares Short Investment Grade Corporate, ProShares Ultra Nasdaq Biotechnology, ProShares UltraPro Biotechnology, ProShares Ultra MSCI EAFE, ProShares Ultra MSCI Emerging Markets, ProShares Ultra FTSE Europe, ProShares MSCI Pacific ex-Japan, ProShares Ultra MSCI Brazil Capped, ProShares Ultra FTSE China 50, ProShares Ultra MSCI Japan, ProShares Ultra MSCI Mexico Capped IMI, ProShares Ultra High Yield, ProShares Ultra Investment Grade Corporate, ProShares UltraShort Gold Miners, ProShares UltraShort Junior Miners, ProShares Ultra Gold Miners and ProShares Ultra Junior Miners*) – Certain of the Funds (or Underlying ETFs in the case of ProShares Morningstar Alternatives Solution ETF) may invest in securities of foreign issuers or other investments that provide a Fund with exposure to foreign issuers (collectively, “foreign investments”). Certain factors related to foreign investments may prevent a Fund from achieving its goals. These factors may include the effects of:

(i) fluctuations in the value of the local currency versus the U.S. dollar and the uncertainty associated with the cost of converting between various currencies, even if a Fund attempts to hedge against its currency exposure; (ii) differences in settlement practices, as compared to U.S. investments, or delayed settlements in some foreign markets; (iii) the uncertainty associated with evidence of ownership of investments in many foreign countries, which may lack the centralized custodial services and rigorous proofs of ownership required by many U.S. investments; (iv) possible regulation of, or other limitations on, investments by U.S. investors in foreign investments; (v) brokerage commissions and fees and other

investment related costs that may be higher than those applicable to U.S. investments; (vi) the possibility that a foreign government may withhold portions of interest and dividends at the source; (vii) taxation of income earned in foreign nations or other taxes imposed with respect to investments in foreign nations; (viii) changes in the denomination currency of a foreign investment; and (ix) foreign exchange controls, which may include suspension of the ability to transfer currency from a given country. In addition, markets for foreign investments are usually less liquid, more volatile and significantly smaller than markets for U.S. securities, which may affect, among other things, a Fund's ability to purchase or sell foreign investments at appropriate times.

A Fund's performance also may be affected by factors related to its ability to obtain information about foreign investments. In many foreign countries, there is less publicly available information about issuers than is available in reports about U.S. issuers. Markets for foreign investments are usually not subject to the degree of government supervision and regulation that exists for U.S. investments. Foreign issuers are not generally subject to uniform accounting, auditing and financial reporting standards, and auditing practices and requirements may not be comparable to those applicable to U.S. issuers. Furthermore, the issuers of foreign investments may be closely controlled by a small number of families, institutional investors or foreign governments whose investment decisions might be difficult to predict. To the extent a Fund's assets are exposed to contractual and other legal obligations in a foreign country, (e.g., swap agreements with foreign counterparties), these factors may affect the Fund's ability to achieve its investment objective. A Fund may encounter difficulties or be unable to pursue legal remedies and obtain judgments in foreign courts. In some countries, information about decisions of the judiciary, other government branches, regulatory agencies and tax authorities may be less transparent than decisions by comparable institutions in the U.S., particularly in countries that are politically dominated by a single party or individual. Moreover, enforcement of such decisions may be inconsistent or uncertain.

Foreign investments also may be more susceptible to political, social, economic and regional factors than might be the case for U.S. securities. These factors include the effect of:

(i) expropriation, nationalization or confiscatory taxation of foreign investments; (ii) changes in credit conditions related to foreign counterparties, including foreign governments and foreign financial institutions; (iii) trade barriers, exchange controls, managed adjustments in relative currency values and other protectionist measures; and (iv) issues related to multi-national currency arrangements; and (v) increased correlation between the value of foreign investments and changes in the commodities markets. To the extent a Fund focuses its investments on a particular country or region, the Fund's ability to meet its investment objectives may be especially subject to factors and developments related to such country or region.

- Special Considerations About Emerging Market Countries (*ProShares Morningstar Alternatives Solution ETF*, *ProShares*

*DJ Brookfield Global Infrastructure ETF*, *ProShares Global Listed Private Equity ETF*, *ProShares Short Term USD Emerging Markets Bond ETF*, *ProShares Hedge Replication ETF*, *ProShares Short MSCI Emerging Markets*, *ProShares Short FTSE China 50*, *ProShares UltraShort MSCI Emerging Markets*, *ProShares UltraShort MSCI Brazil Capped*, *ProShares UltraShort FTSE China 50*, *ProShares UltraShort MSCI Mexico Capped IMI*, *ProShares Ultra MSCI Emerging Markets*, *ProShares Ultra MSCI Brazil Capped*, *ProShares Ultra FTSE China 50*, *ProShares Ultra MSCI Mexico Capped IMI*, *ProShares UltraShort Gold Miners*, *ProShares UltraShort Junior Miners*, *ProShares Ultra Gold Miners* and *ProShares Ultra Junior Miners*) – Because foreign investments of a Fund (or an Underlying ETF in the case of *ProShares Morningstar Alternatives Solution ETF*) may include issuers domiciled in developing or “emerging market” countries, the aforementioned factors are heightened and foreign investments risk is higher. Economic, business, political or social instability may adversely affect the value of emerging market securities more acutely than securities tied to developed foreign market countries. Emerging markets are riskier than more developed markets because they may develop unevenly or may never fully develop. Investments in emerging market countries are considered speculative.

- **Political and Social Risk** – Some governments in emerging markets countries are authoritarian in nature or have been installed or removed as a result of military coups, and some governments have periodically used force to suppress civil dissent. Disparities of wealth, the pace and success of democratization, and ethnic, religious and racial disaffection, have also led to social unrest, violence and/or labor unrest in some emerging market countries. Unanticipated political or social developments may result in sudden and significant investment losses. Also, investing in emerging market countries involves a great risk of loss due to expropriation, nationalization, confiscation of assets and property or the imposition of restrictions on foreign investments and repatriation of capital invested by certain emerging market countries.

- **Economic Risk** – Some emerging market countries have experienced currency devaluations and substantial (and, in some cases, extremely high) rates of inflation, while others have experienced economic recessions causing a negative effect on the economies and securities markets of such emerging countries. Further, economies in emerging market countries generally are dependent heavily upon commodity prices and international trade and, accordingly, may be affected adversely by the economies of their trading partners, trade barriers, exchange controls, managed adjustments in relative currency values, and may suffer from extreme and volatile debt burdens or inflation rates.

- **Geographic Concentration Risk** (*ProShares DJ Brookfield Global Infrastructure ETF*, *ProShares Global Listed Private Equity ETF*, *ProShares MSCI EAFE Dividend Growers ETF*, *Hedged FTSE Europe ETF*, *Hedged FTSE Japan ETF*, *ProShares USD Covered Bond*, *ProShares German Sovereign/Sub-Sovereign ETF*, *ProShares Short Term USD Emerging Markets Bond ETF*,

*ProShares Hedge Replication ETF, ProShares Short MSCI EAFE, ProShares Short MSCI Emerging Markets, ProShares Short FTSE China 50, ProShares UltraShort MSCI EAFE, ProShares UltraShort MSCI Emerging Markets, ProShares UltraShort FTSE Europe, ProShares UltraShort MSCI Pacific ex-Japan, ProShares UltraShort MSCI Brazil Capped, ProShares UltraShort FTSE China 50, ProShares UltraShort MSCI Japan, ProShares UltraShort MSCI Mexico Capped IMI, ProShares Ultra MSCI EAFE, ProShares Ultra MSCI Emerging Markets, ProShares Ultra FTSE Europe, ProShares Ultra MSCI Pacific ex-Japan, ProShares Ultra MSCI Brazil Capped, ProShares Ultra FTSE China 50, ProShares Ultra MSCI Japan, ProShares Ultra MSCI Mexico Capped IMI, ProShares UltraShort Gold Miners, ProShares UltraShort Junior Miners, ProShares Ultra Gold Miners and ProShares Ultra Junior Miners*) – Certain Funds that focus their investments in companies economically tied to particular foreign countries or geographic regions may be particularly susceptible to economic, political or regulatory events affecting those countries or regions. In addition, currency devaluations could occur in foreign countries that have not yet experienced currency devaluation to date, or could continue to occur in foreign countries that have already experienced such devaluations. As a result, funds that focus their investments in companies economically tied to a particular foreign geographic region or country may be more volatile than a more geographically diversified fund.

- **High Yield Credit Risk** (*ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF*) – Exposure to high yield (or “junk”) credit may involve greater levels of credit, liquidity and valuation risk than for higher rated instruments. High yield credit may be more sensitive to economic changes, political changes, or adverse developments specific to a company than other types of credit. High yield credit is also subject to greater risk of loss, greater sensitivity to economic changes, valuation difficulties, and a potential lack of a secondary or public market. High yield credit is considered predominantly speculative with respect to the issuer’s continuing ability to make principal and interest payments and, therefore, such instruments generally involve greater risk of default or price changes than other types of credit. An economic downturn or period of rising interest rates could adversely affect the market for high yield credit and reduce market liquidity (liquidity risk). Less active markets may diminish a Fund’s ability to obtain accurate market quotations when valuing high yield credit and thereby give rise to valuation risk. While the realization of certain of the risks of high yield credit may benefit the Short Fund because the Short Fund seeks investment results that correspond to the inverse of a particular credit market, such occurrences may introduce more volatility to the Fund. In addition, although the Short Fund will have inverse exposure to its relevant credit market, there is no guarantee that the inverse exposure will completely eliminate credit risk.
- **Market Price Variance Risk** (*All Funds*) – Individual shares of a Fund (or an Underlying ETF in the case of ProShares

Morningstar Alternatives Solution ETF) are listed for trading on NYSE Arca, The NASDAQ Stock Market or the BATS Exchange and can be bought and sold in the secondary market at market prices. The market price of shares will fluctuate in response to changes in the value of the Fund’s holdings, supply and demand for shares and other market factors. ProShare Advisors cannot predict whether shares will trade above, below or at a price equal to the value of a Fund’s holdings. Differences between secondary market prices and the value of a Fund’s holdings may be due largely to supply and demand forces in the secondary market, which may not be the same forces as those influencing prices for securities or financial instruments held by a Fund at a particular time. Given the fact that shares can be created and redeemed in Creation Units, ProShare Advisors believes that large discounts or premiums to the value of a Fund’s holdings should not be sustained. However, for ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares Short Term USD Emerging Markets Bond ETF, ProShares CDS North American HY Credit ETF and ProShares Short North American HY Credit ETF, because of the nature of the relevant fixed income, and credit markets, shares may typically trade at a large premium or discount to the Fund’s holdings than shares of many other ETFs. In addition, there may be times when the market price and the value of a Fund’s holdings vary significantly and you may pay more than the value of a Fund’s holdings when buying shares on the secondary market, and you may receive less than the value of a Fund’s holdings when you sell those shares. While the creation/redemption feature is designed to make it likely that shares normally will trade close to the value of a Fund’s holdings, disruptions to creations and redemptions may result in trading prices that differ significantly from the value of a Fund’s holdings. The market price of shares, like the price of any exchange-traded security, includes a “bid-ask spread” charged by the exchange specialist, market makers or other participants that trade the particular security. In times of severe market disruption, the bid-ask spread often increases significantly. This means that shares may trade at a discount to the value of a Fund’s holdings, and the discount is likely to be greatest when the price of shares is falling fastest, which may be the time that you most want to sell your shares. A Fund’s investment results are measured based upon the daily NAV of the Fund. Investors purchasing and selling shares in the secondary market may not experience investment results consistent with those experienced by Authorized Participants creating and redeeming shares directly with a Fund.

- **Restricted Securities Risk** (*ProShares High Yield-Interest Rate Hedged and ProShares USD Covered Bond*) – Privately issued securities are restricted securities that are not publicly traded, and may be less liquid than those that are publicly traded. At times, such securities cannot be readily bought or sold and the Fund might be unable to acquire or dispose of such securities promptly or at reasonable prices, which may result in a loss to the Fund. A restricted security that was liquid at the time of purchase may subsequently become illiquid. An Authorized

Participant that is not a “Qualified Institutional Buyer” as defined in Rule 144A under the Securities Act of 1933, as amended (the “Securities Act”) will not be able to receive, as part of a redemption, restricted securities eligible for resale under Rule 144A.

- **Short Sale Exposure Risk** (*ProShares Morningstar Alternatives Solution ETF, ProShares Large Cap Core Plus, ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares Hedge Replication ETF, ProShares Merger ETF, ProShares RAFT™ Long/Short, ProShares 30 Year TIPS/TSY Spread, ProShares CDS Short North American HY Credit ETF and Short ProShares Funds*) – The Funds may seek inverse or “short” exposure (or in the case of certain Short ProShares Funds, inverse leveraged exposure) through financial instruments such as swap agreements or futures contracts, which may cause the Funds to be exposed to certain risks associated with selling securities short. These risks include, under certain market conditions, an increase in the volatility and decrease in the liquidity of securities or credits underlying the short position, which may lower a Fund’s return, result in a loss, have the effect of limiting a Fund’s ability to obtain inverse or inverse leveraged exposure through financial instruments such as swap agreements or futures contracts, or requiring a Fund to seek inverse or inverse leveraged exposure through alternative investment strategies that may be less desirable or more costly to implement. To the extent that, at any particular point in time, the securities or credits underlying the short position may be thinly-traded or have a limited market, including due to regulatory action, a Fund may be unable to meet its investment objective (e.g., due to a lack of available securities or counterparties). During such periods, the Fund’s ability to issue additional Creation Units may be adversely affected. Obtaining inverse and/or inverse leveraged exposure may be considered an aggressive investment technique. Any income, dividends or payments by the assets underlying a Fund’s short positions will negatively impact the Fund.
- **Trading Risks** (*All Funds*) – Although the shares are listed for trading on NYSE Arca, The NASDAQ Stock Market or the BATS Exchange, and may be listed or traded on U.S. and non-U.S. stock exchanges other than such exchange, there can be no assurance that an active trading market for such shares will develop or be maintained. Trading in shares on an exchange may be halted due to market conditions or for reasons that, in the view of an exchange, make trading in shares inadvisable. In addition, trading in shares on an exchange is subject to trading halts caused by extraordinary market volatility pursuant to exchange “circuit breaker” rules. Short selling of shares is also limited pursuant to SEC rules if the trading price of shares varies by more than 10% from the previous day’s closing price on the exchange. There can be no assurance that the requirements of the exchange necessary to maintain the listing of a Fund will continue to be met or will remain unchanged or that the shares will trade with any volume, or at all, on any stock exchange.

## Additional Securities, Instruments and Strategies

This section describes additional securities, instruments and strategies that may be utilized by a Fund (or an Underlying ETF in the case of ProShares Morningstar Alternatives Solution ETF) that are not principal investment strategies of a Fund unless otherwise noted in the Fund’s description of principal strategies. A more comprehensive description of the types of investments that a Fund may make is set forth in the SAI.

In certain circumstances, an Index Fund that attempts to track the performance of its index by investing all, or substantially all, of its assets in the types of securities that make up the index in approximately the same proportion as the weightings in the index may gain exposure to only a representative sample of the securities in the index, which exposure is intended to have aggregate characteristics similar to the index. In addition, those Index Funds may overweight or underweight certain components contained in the index, or invest in investments not contained in the index but that are designed to provide the requisite exposure to the index.

- **Debt Securities** are fixed income securities, which may include foreign sovereign, sub-sovereign and supranational bonds, as well as any other obligations of any rating or maturity such as foreign and domestic investment grade corporate debt securities and lower-rated corporate debt securities.
  - **Corporate Debt Securities** are debt instruments issued by a corporation that represent the obligation of the corporation to repay a loan face amount with interest within a set period of time. These securities may be of any credit quality and may include junk bonds and securities that are not rated by any rating agency.
  - **Foreign-Currency Denominated Bonds** are debt securities that are issued in non-US currencies.
  - **Other Foreign Debt Securities** may include the debt of sovereigns and/or sub-sovereigns of other foreign countries, or the debt of supranational entities. Supranational entities include organizations designated or supported by governmental entities to promote economic reconstruction or development and international banking institutions and related government agencies.
  - **U.S. Government Securities** are issued by the U.S. government or one of its agencies or instrumentalities. Some, but not all, U.S. government securities are backed by the full faith and credit of the federal government. Other U.S. government securities are backed by the issuer’s right to borrow from the U.S. Treasury and some are backed only by the credit of the issuing organization.
- **Depository Receipts** include American Depositary Receipts (ADRs) and Global Depositary Receipts (GDRs).
  - **ADRs** represent the right to receive securities of foreign issuers deposited in a bank or trust company. ADRs are an alternative to purchasing the underlying securities in their national markets and currencies. Investment in ADRs has certain advantages over direct investment in the underlying foreign securities because: (i) ADRs are U.S. dollar-

denominated investments that are easily transferable and for which market quotations are readily available; and (ii) issuers whose securities are represented by ADRs are generally subject to auditing, accounting and financial reporting standards similar to those applied to domestic issuers.

- **GDRs** are receipts for shares in a foreign-based corporation traded in capital markets around the world. While ADRs permit foreign corporations to offer shares to American citizens, GDRs allow companies in Europe, Asia, the United States and Latin America to offer shares in many markets around the world.
- **Derivatives** are financial instruments whose value is derived from the value of an underlying asset or assets, such as stocks, bonds or funds (including ETFs), interest rates or indexes. A Fund may invest in derivatives as a substitute for directly investing in or shorting stocks, debt or other assets in order to gain exposure, leveraged exposure, inverse exposure or inverse leveraged exposure to an index. These derivatives may include:
  - **Swap Agreements** – Contracts entered into primarily with major global financial institutions for a specified period ranging from a day to more than one year. In a standard “swap” transaction, two parties agree to exchange the return (or differentials in rates of return) earned or realized on particular predetermined investments or instruments. The gross return to be exchanged or “swapped” between the parties is calculated with respect to a “notional amount,” e.g., the return on or change in value of a particular dollar amount invested in a “basket” of securities or an ETF representing a particular index.
  - **Futures Contracts** – Standardized contracts traded on, or subject to the rules of, an exchange that call for the future delivery of a specified quantity and type of asset at a specified time and place or, alternatively, may call for a cash settlement. Credit index futures provide exposure to the credit of a number of reference entities. Unlike CDS, certain credit index futures do not provide protection against events of default. ProShares Managed Futures Strategy, an Underlying ETF, invests in futures contracts and is subject to risks related to rolling. The contractual obligations of a buyer or seller holding a futures contract to expiration may generally be satisfied by taking or making physical delivery of the underlying reference asset or settling in cash as designated in the contract specifications. Alternatively, futures contracts may be closed out prior to expiration by making an offsetting sale or purchase of an identical futures contract on the same or linked exchange before the designated date of delivery. Once this date is reached, the futures contract “expires.” As the futures contracts held by the Underlying ETFs near expiration, they are generally closed out and replaced by contracts with a later expiration. This process is referred to as “rolling.” Underlying ETFs do not intend to take physical delivery of any reference assets underlying a futures contract, but instead to “roll” their positions.

When the market for these contracts is such that the prices are higher in the more distant delivery months than in the nearer delivery months, the sale during the course of the “rolling process” of the more nearby contract would take place at a price that is lower than the price of the more distant contract. This pattern of higher futures prices for longer expiration futures contracts is often referred to as “contango.” Alternatively, when the market for these contracts is such that the prices are higher in the nearer months than in the more distant months, the sale during the course of the “rolling process” of the more nearby contract would take place at a price that is higher than the price of the more distant contract. This pattern of higher futures prices of shorter expiration futures contracts is referred to as “backwardation.”

There have been extended periods in which contango or backwardation has existed in the futures contract markets for various types of futures contracts, and such periods can be expected to occur in the future. The presence of contango in certain commodity futures contracts at the time of rolling would be expected to adversely affect long positions held by the Underlying ETF and positively affect short positions held by the Underlying ETF. Similarly, the presence of backwardation in certain commodity futures contracts at the time of rolling such contracts would be expected to adversely affect short positions held by the Underlying ETF and positively affect long positions held by the Underlying ETF.

- **Forward Contracts** – Two-party contracts where a purchase or sale of a specific quantity of a commodity, security, foreign currency or other financial instrument is entered into with dealers or financial institutions at a set price, with delivery and settlement at a specified future date. Forward contracts may also be structured for cash settlement, rather than physical delivery.

Certain Underlying ETFs (in the case of ProShares Morningstar Alternatives Solution ETF) obtain investment exposure through derivatives (including investing in swap agreements, futures contracts, options on futures contracts, securities and indexes, forward contracts and similar instruments), which may be considered aggressive. When one of these Underlying ETFs uses derivatives, there may be imperfect correlation between the value of the reference asset(s) underlying the derivative (e.g., the securities in the index) and the derivative, which may prevent the Underlying ETF from achieving its investment objective. Because derivatives often require limited initial investment, the use of derivatives also may expose the Underlying ETF to losses in excess of those amounts initially invested. The use of derivatives also exposes the Underlying ETF to risks different from, or possibly greater than, the risks associated with investing directly in the reference asset(s) underlying the derivative (e.g., the securities contained in the Underlying ETF's index). These include: 1) the risk that there may be imperfect correlation between the price of the financial instruments and movements in the prices of the reference

asset(s); 2) the risk that an instrument is mispriced; 3) credit or counterparty risk on the amount the Underlying ETF expects to receive from a counterparty; 4) the risk that securities prices, interest rates and currency markets will move adversely and the Underlying ETF will incur significant losses; 5) the risk that the cost of holding a financial instrument might exceed its total return; and 6) the possible absence of a liquid secondary market for a particular instrument and possible exchange-imposed price fluctuation limits, either of which may make it difficult or impossible to adjust the Underlying ETF's position in a particular instrument when desired.

In addition, the Underlying ETFs may use a combination of swaps on an underlying index and swaps on an ETF that is designed to track the performance of that index. The performance of an ETF may not track the performance of its underlying index due to embedded costs and other factors. Thus, to the extent one of these Underlying ETFs invests in swaps that use an ETF as the reference asset, the Underlying ETF may be subject to greater correlation risk and may not achieve as high a degree of correlation with its index as it would if the Underlying ETF only used swaps on the underlying index.

Moreover, with respect to the use of swap agreements, if an index has a dramatic intraday move that causes a material decline in one of these Underlying ETFs' net assets, the terms of a swap agreement between such Underlying ETF and its counterparty may permit the counterparty to immediately close out the transaction with the Underlying ETF. In that event, an Underlying ETF may be unable to enter into another swap agreement or invest in other derivatives to achieve the desired exposure consistent with its investment objective. This, in turn, may prevent the Underlying ETF from achieving its investment objective, even if the index reverses all or a portion of its intraday move by the end of the day. Any costs associated with using derivatives may also have the effect of lowering the Underlying ETF's return.

- **Investments in Other Investment Companies** – A Fund may invest in the securities of other investment companies, including exchange-traded funds (ETFs), to the extent that such an investment would be consistent with the requirements of the 1940 Act or any exemptive order issued by the SEC. If a Fund invests in, and, thus, is a shareholder of, another investment company, the Fund's shareholders will indirectly bear the Fund's proportionate share of the fees and expenses paid by such other investment company, including advisory fees, in addition to both the management fees payable directly by the Fund to the Fund's own investment advisor and the other expenses that the Fund bears directly in connection with the Fund's own operations.
  - **Exchange-Traded Funds (ETFs)** – A Fund may invest in shares of other ETFs, which are registered investment companies that are traded on stock exchanges and hold assets such as stocks or bonds.
- **Money Market Instruments** are short-term debt instruments that have a remaining maturity of 397 days or less and exhibit high

quality credit profiles. Money market instruments may include U.S. government securities, securities issued by governments of other developed countries and repurchase agreements, including:

- **U.S. Treasury Bills** are U.S. government securities that have initial maturities of one year or less, and are supported by the full faith and credit of the U.S. government.
- **Repurchase Agreements** are contracts in which a seller of securities, usually U.S. government securities or other money market instruments, agrees to buy them back at a specified time and price. Repurchase agreements are primarily used by the Funds as short-term investments for cash positions.

## Additional Securities, Instruments and Strategies of ProShares Morningstar Alternatives Solution ETF

### A Further Discussion of Principal Investment Strategies

**Overview** – The Fund allocates and reallocates its assets among the Underlying ETFs consistent with the allocation and reallocation of securities in the Index as determined by Morningstar. Certain Underlying ETFs may invest in non-U.S. securities and debt instruments, which are subject to additional risks, as described in this Prospectus and in the Fund's SAI.

**The Underlying ETFs** – The Fund seeks to track the investment results of the Index, which is designed to provide diversified exposure to alternative asset classes in order to enhance risk adjusted portfolio returns when combined with a range of traditional investments. Each Underlying ETF generally holds assets that provide exposure to such ETF's underlying Index or benchmark. The Fund's allocation of assets to the Underlying ETFs will generally closely reflect the allocation weights represented in the Index. Underlying ETFs may take different forms and may not always be registered under the 1940 Act.

The following table lists the Fund's investments and asset allocation as of June 30, 2015. ProShare Advisors allocates the Fund's assets among the Underlying ETFs in accordance with the Fund's investment objective and policies. ProShare Advisors is not required to invest the Fund's assets in all of the Underlying ETFs or in any particular percentage in any given Underlying ETF.

**Underlying ETF Allocation Weights**  
(as of June 30, 2015 Rounded to the nearest 0.01%)

#### Underlying ETFs

ProShares Hedge Replication ETF	23.06%
ProShares RAFI Long/Short	11.54%
ProShares Merger ETF	16.37%
ProShares Managed Futures Strategy*	25.05%
ProShares 30 Year TIPS/TSY Spread	2.54%
ProShares DJ Brookfield Global Infrastructure ETF	10.07%
ProShares Global Listed Private Equity ETF	11.37%

\* ProShares Managed Futures Strategy is not a mutual fund or any other type of investment company as defined in the 1940 Act, and it is not subject to regulation thereunder.

In managing each of the Underlying ETFs, ProShare Advisors attempts to track the performance of the underlying index by

investing all, or substantially all, of the Underlying ETF's assets in securities or financial instruments that make up the underlying index, or in financial instruments that provide similar exposure. An Underlying ETF may invest in only a representative sample of the securities in its underlying index and may overweight or underweight securities of its underlying index in relation to their composition in the underlying index, with the intent of obtaining exposure with aggregate characteristics similar to those of the underlying index. Additional information regarding the Underlying ETFs and their principal investment strategies is provided below.

*ProShares Hedge Replication ETF (HDG)* seeks investment results, before fees and expenses, that track the performance of the Merrill Lynch Factor Model – Exchange Series ("Factor Model"). The fund invests in securities and derivatives that ProShare Advisors believes, in combination, should track the performance of the Factor Model. The Factor Model, established by Merrill Lynch International, seeks to provide the risk and return characteristics of the hedge fund asset class by targeting a high correlation to the HFRI Fund Weighted Composite Index (the HFRI). The HFRI is designed to reflect hedge fund industry performance through an equally weighted composite of over 2000 constituent funds. In seeking to maintain a high correlation with the HFRI, the Factor Model utilizes a systematic model to establish, each month, weighted long or short (or, in certain cases, long or flat) positions in six underlying factors ("Factors"). The Factors that comprise the Factor Model are (1) the S&P 500 Total Return Index, (2) the MSCI EAFE US Dollar Net Total Return Index, (3) the MSCI Emerging Markets US Dollar Net Total Return Index, (4) the Russell 2000 Total Return Index, (5) three-month U.S. Treasury Bills, and (6) the ProShares UltraShort Euro ETF. The Factor Model is not comprised of, and ProShares Hedge Replication ETF does not invest in, any hedge fund or group of hedge funds. The Factor Model is published under the Bloomberg ticker symbol "MLEIFCTX." It is expected that, at any given point in time, the fund will be substantially invested in three-month U.S. Treasury Bills, which is one of the Factors, or other short-term debt instruments that have a remaining maturity of 397 days or less and exhibit high quality credit profiles in order to gain exposure to the three-month U.S. Treasury Bill rate.

*ProShares RAFI™ Long/Short (RALS)* seeks investment results, before fees and expenses, that track the performance of the RAFI™ US Equity Long/Short Index. The fund invests in securities and derivatives that ProShare Advisors believes, in combination, should track the performance of the index. The fund (Bloomberg Ticker: "RAFILS") allocates an aggregate equal dollar amount to both long and short equity positions. This allocation is based on a comparison of Research Affiliates Fundamental Index® weightings with traditional market capitalization weightings. The index methodology seeks to capitalize on a theory that traditional index weighting based on market capitalization results in overweighting of overpriced securities and underweighting of underpriced securities.

*ProShares Merger ETF (MRGR)* seeks investment results, before fees and expenses, that track the performance of the S&P Merger Arbitrage Index. The fund is designed to track the performance of

the index and provide exposure to a global merger arbitrage strategy. The Index, and by extension the fund, seeks to produce consistent, positive returns in virtually all market environments, although there are no assurances it will achieve this result. A global merger arbitrage strategy seeks to capture the spread between the price at which the stock of a company (each such company, a "Target") trades after a proposed acquisition of such Target is announced and the value (cash plus stock) that the acquiring company (the "Acquirer") has proposed to pay for the stock of the Target (a "Spread"). Such a Spread typically exists due to the uncertainty that the announced merger, acquisition or other corporate reorganization (each, a "Deal") will close, and if it closes, that such Deal will be at the initially proposed economic terms. For Deals that close, the price of the Target after the Deal is announced is expected to approach the proposed acquisition price by the closing date of the Deal, resulting in a gain to strategies such as the index's, which attempt to capture this Spread. The size of the Spread will depend on several factors, including the perceived risk of the Deal closing and the length of time expected until the Deal is completed. For Deals that are not consummated, the price of the Target commonly falls back to pre-announcement levels, typically resulting in significant losses well in excess of the post announcement Spread the strategy attempts to capture.

*ProShares Managed Futures Strategy (FUTS)* seeks to achieve positive total returns in rising or falling markets that are not directly correlated to broad market equity or fixed income returns. The Fund seeks to provide investment results that generally correspond (before fees and expenses) to the performance of the S&P Strategic Futures Index. The S&P Strategic Futures Index was developed by Standard & Poor's and is a long/short rules-based investable index that seeks to capture the economic benefit derived from both rising and declining trends in futures prices. The S&P Strategic Futures Index is composed of unleveraged long or short positions in U.S. exchange-traded futures contracts on 16 different tangible commodities, as well as futures contracts on 8 different financials, such as major currencies and U.S. Treasury securities.

*ProShares 30 Year TIPS/TSY Spread (RINF)* seeks investment results, before fees and expenses, that track the performance of the Credit Suisse 30-Year Inflation Breakeven Index. The fund, under normal circumstances, seeks to remain fully exposed to the index and will invest at least 80% of its total assets in securities of the index. In addition, the fund will invest in derivatives and other fixed income securities that ProShare Advisors believes, in combination, should track the performance of its index. The index tracks the performance of long positions in the most recently issued 30-year Treasury Inflation-Protected Securities ("TIPS") bond and duration-adjusted short positions in U.S. Treasury bonds of the closest maturity. The difference in yield (or "spread") between these bonds (Treasury yield minus TIPS yield) is commonly referred to as a "breakeven rate of inflation" ("BEI"). The 30-Year BEI is considered to be a measure of the market's expectations for inflation over the next thirty years. The index (and the fund) is designed to appreciate as the BEI increases. An increase in the BEI occurs if: (1) the yield on Treasuries rise (i.e., the price of the Treasuries decreases) relative to the yield on TIPS;

or (2) the yield on TIPS falls (i.e., the price of the TIPS increases) relative to the yield on Treasuries. Conversely, the index (and the fund) is designed to depreciate if the BEI decreases. A decrease in the BEI occurs if: (1) the yield on Treasuries falls (i.e., the price of the Treasuries increases) relative to the yield on TIPS; or (2) the yield on TIPS rises (i.e., the price of the TIPS decreases) relative to the yield on Treasuries. The level of the index (and the fund) will fluctuate based on changes in the value of the underlying bonds, which likely will not be the same on a percentage basis as changes in the BEI. The index is not designed to measure the realized rate of inflation, nor does it seek to replicate the returns of any index or measure of actual consumer price levels.

*ProShares DJ Brookfield Global Infrastructure ETF (TOLZ)* seeks investment results, before fees and expenses, that track the performance of the Dow Jones Brookfield Global Infrastructure Composite Index. The index, constructed and maintained by S&P Dow Jones Indices LLC, consists of companies domiciled globally that qualify as “pure-play” infrastructure companies - companies whose primary business is the ownership and operation of infrastructure assets, activities that generally generate long-term stable cash flows. Eligible companies must have more than 70% of cash flows derived from the following infrastructure assets (exclusive of cash flow from infrastructure-related businesses, such as energy exploration and generation): Airports; Toll Roads; Ports; Communications; Electricity Transmission & Distribution; Oil & Gas Storage & Transportation; Water; or Diversified (multiple infrastructure assets). Additionally, companies must meet minimum market capitalization and trading volume requirements. Index weights are based on a modified free-float adjusted market capitalization methodology. The index is reconstituted and rebalanced quarterly in March, June, September and December.

*ProShares Global Listed Private Equity ETF (PEX)* seeks investment results, before fees and expenses, that track the performance of the LPX Direct Listed Private Equity Index. The index, published by LPX AG (“LPX”), consists of up to 30 qualifying listed private equity companies. A listed private equity company is an eligible candidate for the index if its direct private equity investments, as well as cash and cash equivalent positions and post-initial public offering listed investments, represent more than 80% of the total assets of the company. LPX considers direct private equity investments to be direct investments noted on the balance sheet of the listed private equity company in the equity, mezzanine or debt facility of an underlying private company or investments in limited partnerships managed by the management portion of the listed private equity company. Each candidate for the index will have a majority of its assets invested in or exposed to private companies or have a stated intention to have a majority of its assets invested in or exposed to private companies. The index applies a liquidity screen to qualifying companies and then includes up to 30 of the remaining companies based, among other things, on greater relative trading volume (i.e. trading volume relative to the market capitalization of the company) – the index historically has included securities of all market capitalizations, from micro- to large-cap.

## Precautionary Notes

- **A Precautionary Note to Retail Investors** – The Depository Trust Company (“DTC”), a limited trust company and securities depository that serves as a national clearinghouse for the settlement of trades for its participating banks and broker-dealers, or its nominee will be the registered owner of all outstanding shares of each Fund. Your ownership of shares will be shown on the records of DTC and the DTC Participant broker through whom you hold the shares. PROSHARES TRUST WILL NOT HAVE ANY RECORD OF YOUR OWNERSHIP. Your account information will be maintained by your broker, who will provide you with account statements, confirmations of your purchases and sales of shares, and tax information. Your broker also will be responsible for furnishing certain cost basis information and ensuring that you receive shareholder reports and other communications from the Fund whose shares you own. Typically, you will receive other services (e.g., average cost information) only if your broker offers these services.
- **A Precautionary Note to Purchasers of Creation Units** – You should be aware of certain legal risks unique to investors purchasing Creation Units directly from the issuing Fund. Because new shares from a Fund may be issued on an ongoing basis, a “distribution” of that Fund’s shares could be occurring at any time. As a dealer, certain activities on your part could, depending on the circumstances, result in your being deemed a participant in the distribution, in a manner that could render you a statutory underwriter and subject you to the prospectus delivery and liability provisions of the Securities Act. For example, you could be deemed a statutory underwriter if you purchase Creation Units from an issuing Fund, break them down into the constituent shares, and sell those shares directly to customers, or if you choose to couple the creation of a supply of new shares with an active selling effort involving solicitation of secondary market demand for shares. Whether a person is an underwriter depends upon all of the facts and circumstances pertaining to that person’s activities, and the examples mentioned here should not be considered a complete description of all the activities that could cause you to be deemed an underwriter. Dealers who are not “underwriters,” but are participating in a distribution (as opposed to engaging in ordinary secondary market transactions), and thus dealing with shares as part of an “unsold allotment” within the meaning of Section 4(3)(C) of the Securities Act, will be unable to take advantage of the prospectus delivery exemption provided by Section 4(3) of the Securities Act.
- **A Precautionary Note to Investment Companies** – For purposes of the 1940 Act, each Fund is a registered investment company, and the acquisition of a Fund’s shares by other investment companies is subject to the restrictions of Section 12(d)(1) thereof.

The Trust and the Funds have obtained an exemptive order from the SEC allowing a registered investment company to invest in Fund shares beyond the limits of Section 12(d)(1) subject to certain conditions, including that a registered investment company enters into a Participation Agreement with the Trust regarding the terms of the investment. **ProShares Morningstar Alter-**

**natives Solution ETF, ProShares Global Listed Private Equity ETF, ProShares Ultra High Yield, ProShares Ultra Investment Grade Corporate, ProShares Ultra Gold Miners and ProShares Ultra Junior Miners do not currently rely on the exemptive order, meaning that an investment company's acquisition of such Fund's shares remains subject to the limits of Section 12(d)(1).** Any investment company considering purchasing shares of a Fund in amounts that would cause it to exceed the restrictions of Section 12(d)(1) should contact the Trust.

- **A Precautionary Note Regarding Unusual Circumstances** – ProShares Trust can postpone payment of redemption proceeds for any period during which: (1) the New York Stock Exchange (the “NYSE”), The NASDAQ Stock Market, NYSE Arca or the BATS Exchange is closed other than customary weekend and holiday closings; (2) trading on the NYSE, The NASDAQ Stock Market, NYSE Arca or the BATS Exchange is restricted; (3) any emergency circumstances exist, as determined by the SEC; (4) the SEC by order permits for the protection of shareholders of a Fund; and (5) for up to 14 calendar days for any Fund holding non-U.S. investments or any of the Short International or Ultra International ProShares Funds during a period of an international local holiday, as further described in the SAI.
- **A Precautionary Note Regarding Regulatory Initiatives** – There is a possibility of future regulatory changes altering, perhaps to a material extent, the nature of an investment in the Funds or the ability of the Funds to continue to implement their investment strategies.

The futures markets are subject to comprehensive statutes, regulations, and margin requirements. In addition, the SEC, CFTC and the exchanges are authorized to take extraordinary actions in the event of a market emergency, including, for example, the retroactive implementation of speculative position limits or higher margin requirements, the establishment of daily price limits and the suspension of trading. The regulation of swaps and futures transactions in the United States is a rapidly changing area of law and is subject to modification by government and judicial action. The effect of any future regulatory change on the Funds is impossible to predict, but could be substantial and adverse.

In particular, the Dodd-Frank Wall Street Reform and Consumer Protection Act (the “Dodd-Frank Act”) was signed into law on July 21, 2010. The Dodd-Frank Act has changed and will continue to change the way in which the U.S. financial system is supervised and regulated. Title VII of the Dodd-Frank Act sets forth a legislative framework for OTC derivatives, including financial instruments, such as swaps, in which the Funds may invest. Title VII of the Dodd-Frank Act made broad changes to the OTC derivatives market, granted significant authority to the SEC and the CFTC to regulate OTC derivatives and market participants, and will require clearing and exchange trading of many OTC derivatives transactions.

Provisions in the Dodd-Frank Act include new registration, record-keeping, capital and margin requirements for “swap dealers” and “major swap participants” as determined by the Dodd-Frank Act and applicable regulations; and the forced use of clearinghouse mechanisms for many OTC derivative

transactions. The CFTC, SEC and other federal regulators have been tasked with developing the rules and regulations enacting the provisions of the Dodd-Frank Act. While certain of the rules are now effective, other rules are not yet final, so it is not possible at this time to gauge the exact nature and scope of the impact of the Dodd-Frank Act on any of the Funds. However, it is expected that swap dealers, major market participants and swap counterparties will experience new and/or additional regulations, requirements, compliance burdens and associated costs. New regulations could, among other things, adversely affect the value of the investments held by a Fund, restrict a Fund's ability to engage in derivatives transactions (for example, by making certain derivatives transactions no longer available to that Fund) and/or increase the costs of such derivatives transactions (for example, by increasing margin or capital requirements), which could adversely affect investors. It is unclear how the regulatory changes will affect counterparty risk. In particular, new position limits imposed on a Fund or its counterparties may impact that Fund's ability to invest in a manner that efficiently meets its investment objective, and new requirements, including capital and mandatory clearing for certain swaps, may increase the cost of a Fund's investments and cost of doing business, which could adversely affect investors.

### Additional Information on Certain Underlying Indexes

The Funds operate pursuant to licensing agreements for the use of the indexes. Market capitalizations for such indexes that appear in the Summary Prospectuses have been compiled by ProShare Advisors using third party sources. A brief description of each Fund's index is included in each Summary Prospectus, as supplemented below:

#### ProShares Morningstar Alternatives Solution ETF:

**ProShares Morningstar Alternatives Solution ETF** Fund is a fund of ETFs and seeks to achieve its investment objective by investing primarily in the securities of the Underlying ETFs, each of which is a ProShares ETF.

The Fund is designed to provide investors with a comprehensive solution to their alternatives allocation by investing in the alternative ETFs (i.e., ETFs that invest in alternative asset classes or that have non-traditional investment strategies) comprising its index. The Index seeks to provide diversified exposure to alternatives asset classes. The index consists of a comprehensive set of exchange traded funds (ETFs) in the ProShares lineup that employ alternative and non-traditional strategies such as long/short, market neutral, managed futures, hedge-fund replication, private equity, infrastructure or inflation-related investments. The index is constructed to enhance risk adjusted portfolio returns when used in combination with traditional investments. As of June 30, 2015 the Underlying ETFs include: ProShares Hedge Replication ETF, ProShares RAFI Long/Short, ProShares Merger ETF, ProShares Managed Futures Strategy, ProShares 30 Year TIPS/TSY Spread, ProShares DJ Brookfield Global Infrastructure ETF and ProShares Global Listed Private Equity ETF. The Index is constructed and maintained by Morningstar, Inc., using the asset allocation expertise of its affiliate, Ibbotson Associates, Inc., a division of Morningstar Investment Management.

In order to qualify for the Index, Underlying ETFs must be (a) sponsored or advised by ProShare Advisors or its affiliates and (b) must be traded on a US Securities Exchange. The optimization process that calculates the allocation to a particular Underlying ETF is applied on an annual basis and is determined by the improvement in portfolio risk/return characteristics each Underlying ETF provides to a portfolio that is comprised of 60-75% equities and 25-40% bonds. The weight of each individual constituent of the portfolio is obtained by maximizing portfolio expected return such that expected portfolio risk is less than or equal to portfolio aggregate risk. The maximum allocation to any particular ETF is 30%.

While the base weights are determined annually via the optimization process, the Index also applies a tactical momentum signal on a monthly basis designed to increase or decrease the allocations based on the change in price over time of each Underlying ETF. At each monthly rebalance, the momentum signal tilts the index towards asset classes that exhibit positive trends in their performance based on 6-month trailing returns. The top two asset classes receive a +2% adjustment to their weighting, while the bottom two asset classes receive a -2% adjustment.

The annual reconstitution and determination of base weights occurs annually in April, while the rebalancing and application of momentum signal occurs on a monthly basis. The Index is published under the Bloomberg ticker symbol "DIVALTT."

### ProShares DJ Brookfield Global Infrastructure ETF:

The Dow Jones Brookfield Global Infrastructure Composite Index, constructed and maintained by S&P Dow Jones Indices LLC, consists of companies domiciled globally that qualify as "pure-play" infrastructure companies – companies whose primary business is the ownership and operation of infrastructure assets, activities that generally generate long-term stable cash flows. The Index includes Master Limited Partnerships ("MLPs") in addition to other equity securities.

To be included in the Index, companies must meet the following requirements:

- Minimum float-adjusted market capitalization of US\$ 500 million.
- Minimum three-month average daily trading volume of US\$ 1 million.
- Listed in a developed market country. Companies domiciled in emerging market countries and listed on a developed market exchange are eligible.
- More than 70% of cash flows derived from the following infrastructure assets:
  - Airports: Development, ownership, lease, concession, or management of an airport and related facilities.
  - Toll Roads: Development, ownership, lease, concession, or management of a toll road and related facilities.
  - Ports: Development, ownership, lease, concession, or management of a seaport and related facilities.

- Communications: Development, lease, concession, or management of broadcast/mobile towers, satellites, fiber optic/copper cable.
  - Excludes telecom services
- Electricity Transmission & Distribution: Development, ownership, lease, concession, or management of electricity transmission and distribution assets.
  - Excludes generation, exploration, and production of energy products.
- Oil & Gas Storage & Transportation: Development, ownership, lease, concession, or management of oil and gas (and other bulk liquid products) fixed transportation or storage assets and related midstream energy services.
- Water: Development, lease, concession or management of water-related infrastructure, including water distribution, waste-water management, and purification/desalination.
- Diversified: Multiples sources of above or investment fund with a primary focus towards infrastructure investments.

Index weights are based on a modified free-float adjusted market capitalization methodology. Individual stock weights are capped at 10%, country weights are capped at 50%, industry weights are capped at 50% and MLPs are capped at 25% of the index.

The Index is reconstituted and rebalanced quarterly in March, June, September and December. The Index is published under the Bloomberg ticker symbol "DJBGICUT."

As of June 30, 2015, securities listed in the following countries (regardless of domicile) are eligible for inclusion in the Index: Australia, Belgium, Brazil, Canada, China, France, Germany, Hong Kong, Italy, Japan, Luxembourg, Mexico, Netherlands, New Zealand, Russia, Singapore, Spain, Switzerland, UAE, the United Kingdom and the United States.

### ProShares Global Listed Private Equity ETF:

The LPX Direct Listed Private Equity Index, published by LPX AG ("LPX"), consists of up to 30 qualifying listed private equity companies taken from a database of all listed private equity companies listed worldwide, to the extent known to LPX. To be eligible for inclusion in the database, the predominant business purpose of a company must be private equity. This means that the private equity portion of the company's business must represent more than 50% of the total assets of the company. The "private equity portion" includes direct and indirect private equity investments, the value of the company's private equity fund management business, as well as cash and cash equivalent positions and post-Initial Public Offering listed investments.

A listed private equity company is an eligible candidate for the Index only if the private equity portion of its business, excluding the indirect private equity investments and excluding the valuation of the private equity fund management business, represents more than 80% of the total assets of the company. LPX considers direct private equity investments to be direct investments noted on the balance sheet of the listed private equity company in the equity, mezzanine or debt facility of an underlying private

company or investments in limited partnerships managed by the management portion of the listed private equity company. Candidates for the index will have a majority of its assets invested in or exposed to private companies or have a stated intention to have a majority of its assets invested in or exposed to private companies. At times, the Index (and, accordingly, the Fund) may include private equity companies whose assets may consist largely of cash or cash equivalents. This may occur, for example, when a private equity company divests itself of its investments in a portfolio company or companies (e.g., after a portfolio company's IPO, merger, or recapitalization) in exchange for cash or cash equivalents, and may continue until the private equity company identifies a new portfolio company investment or investments to make.

The Index components are then further screened based on an annual liquidity analysis based on: (a) bid/ask spreads; (b) average market capitalization; (c) average trading volume relative to market capitalization; and (d) trade continuity (or the length of time between executed trades in the stock). Index weights are based on a capped float-adjusted, modified market capitalization methodology. A "capped" index is one that limits the weight of any single security within the index, in this case designed to generally ensure compliance with the diversification requirements of the Internal Revenue Code of 1986, as amended, applicable to regulated investment companies (e.g., no greater than 25% of the Index is invested in the securities (other than U.S. government securities and the securities of other regulated investment companies) of any one issuer). A "float adjusted" index adjusts an issuer's weight in the index based on the number of shares available for purchase on an open market that are outstanding multiplied by the issuer's share price. A "modified market capitalization methodology" indicates that the index is not using the standard market capitalization weightings that adjusts an issuer's weight in an index based on the number of shares outstanding multiplied by the issuer's share price.

The Index is reconstituted and rebalanced quarterly (in January, April, July and October).

### ProShares Large Cap Core Plus:

The Credit Suisse 130/30 Large Cap Index is designed to replicate an investment strategy that establishes either long or short positions in the stocks of 500 leading large-cap U.S. companies (the "Universe") by applying a rules-based ranking and weighting methodology detailed below. The design intends to provide an indexed representation of a quantitatively constructed 130/30 U.S. large cap equity strategy. This results in the index having total long exposure of 130% and total short exposure of 30% at each monthly reconstitution date. The index will have risk characteristics similar to the Universe and will generally rise and fall with the Universe, with the goal, but not guarantee, of incremental risk-adjusted outperformance as compared to the Universe.

Reconstitution of the index occurs on the third Friday of each month and begins by identifying the universe of stocks for potential selection into the index. Using a quantitative analysis, an expected alpha score (or rank) is assigned to each stock in the

Universe. Expected alpha is a forecast of a stock's risk-adjusted return. The expected alpha score is derived using 50 factors that capture key company information, including fundamental data from financial statements, consensus earnings forecasts, market pricing and volume data. These 50 factors are grouped into ten equal-weighted factor composites in the following categories: 1) Traditional Value; 2) Relative Value; 3) Historical Growth; 4) Expected Growth; 5) Profit Trends; 6) Accelerating Sales; 7) Earnings Momentum; 8) Price Momentum; 9) Price Reversal; and 10) Small Size. Each stock in the Universe is scored on each of the 10 composite factors, and these scores are then combined to generate a single, overall expected alpha score.

Once an expected alpha score is derived for each stock in the Universe, an optimized long/short index portfolio is generated based on these scores, with its long and short positions set at 130% and 30%, respectively. The primary goal of the optimization process is to maximize the index portfolio's potential estimated return while maintaining risk characteristics similar to the Universe. Between reconstitutions, risk characteristics of the index will diverge from those of the Universe.

Each stock in the index portfolio may be over- or under-weighted by a maximum of 0.40%, based on its expected alpha score. This means that a stock with a high score may have a portfolio weight that is as much as 0.40% above its float-adjusted market capitalization weighting. A stock with a low score may have a portfolio weight that is as much as 0.40% below its market capitalization weighting. In cases where a stock's market capitalization weighting is under 0.40% and the company is assigned a low alpha score, it may carry a negative weighting and be held as a short position. The optimization process commonly sets the weight for numerous stocks in the Universe to zero, so that the Index portfolio may include fewer than 500 stocks.

At the index's next monthly reconstitution, new equity scores are calculated, the long/short ratio is reset to 130/30 and new equity weights are computed.

### ProShares S&P MidCap 400 Dividend Aristocrats ETF:

The S&P MidCap 400<sup>®</sup> Dividend Aristocrats Index (the "MidCap Aristocrats Index"), constructed and maintained by S&P Dow Jones Indices LLC, targets companies that are currently members of the S&P MidCap 400<sup>®</sup> Index and have increased dividend payments each year for at least 15 years. The MidCap Aristocrats Index includes all companies meeting these requirements with a minimum of 40 stocks, each of which is equally weighted. No single sector is allowed to comprise more than 30% of the MidCap Aristocrats Index's weight. If there are fewer than 40 stocks with at least 15 consecutive years of dividend growth or if sector caps are breached, the MidCap Aristocrats Index will include companies with shorter dividend growth histories beginning with 14 consecutive years and adding companies with progressively fewer years until the MidCap Aristocrats Index complies with its rules. Companies with the same dividend growth history (i.e., the same number of consecutive years of dividend growth) are selected in order of dividend yield, beginning with companies having the highest dividend yield and progressing to those with lower dividend yields, as necessary.

As of June 30, 2015, the Index included companies with capitalizations between approximately \$1.8 billion and \$10.6 billion.

The MidCap Aristocrats Index is rebalanced each January, April, July and October, with an annual reconstitution during the January rebalance. The MidCap Aristocrats Index is published under the Bloomberg ticker symbol “SPDAMCUT”.

### **ProShares Russell 2000 Dividend Growers ETF:**

The Russell 2000 Dividend Growth Index (the “Russell Index”), constructed and maintained by Russell Investments, targets companies that are currently members of the Russell 2000 Index, have increased dividend payments each year for at least 10 consecutive years, and are not in the bottom 20% of Russell 2000 Index liquidity based on 20 day average daily dollar trading volume (collectively, the “Initial Index Requirements”). The Russell Index contains a minimum of 40 stocks, which are equally weighted, and no single sector is allowed to comprise more than 30% of the Russell Index’s weight. The Russell Index includes all companies meeting the Initial Index Requirements, unless, as described below, sector caps are breached. If there are fewer than 40 stocks with at least 10 consecutive years of dividend growth, the Russell Index will include companies with shorter dividend growth histories beginning with nine consecutive years and adding companies with progressively fewer years until the Russell Index complies with its rules. Companies with the same dividend growth history (i.e., the same number of consecutive years of dividend growth) are selected in order of dividend yield, beginning with companies having the highest dividend yield and progressing to those with lower dividend yields, as necessary. If sector caps are breached, then companies in the applicable sector are removed beginning with companies with the lowest yield, and progressively moving to companies with higher yields, as necessary until the Russell Index complies with its rules. If sector caps are breached and there are companies with fewer than 10 consecutive years of dividend growth in the relevant sector(s), those companies would be removed first, beginning with those companies having the lowest yield and progressively moving to those companies with higher yields.

As of June 30, 2015, the Index included companies with capitalizations between approximately \$618 million and \$4.2 billion.

The Russell Index is rebalanced each March, June, September and December with an annual reconstitution during the June rebalance. The Russell Index is published under the Bloomberg ticker symbol “R2DIVGRO”.

### **ProShares MSCI EAFE Dividend Growers ETF**

The MSCI EAFE Dividend Masters Index (the “EAFE Masters Index”), constructed and maintained by MSCI, targets companies that are currently members of the MSCI EAFE Index (“MSCI EAFE”) and have increased dividend payments each year for at least 10 years. The EAFE Masters Index contains a minimum of 40 stocks (as of its annual reconstitution), which are equally weighted. No single sector is allowed to comprise more than 30% of the EAFE Masters Index weight, and no single country is allowed to comprise more than 50% of the EAFE Masters Index weight. The EAFE Masters Index is rebalanced each February,

May, August and November, with an annual reconstitution during the November rebalance.

If the MSCI EAFE does not contain 40 stocks that have increased dividend payments each year for at least 10 years, or if sector and country caps are breached, the EAFE Masters Index may include MSCI EAFE components with fewer years of dividend growth history, beginning with 9 years and adding components with progressively fewer years of dividend growth history until the Index complies with its rules. As the Index adds components from a particular year (for example, nine years of dividend growth), stocks are selected in order of dividend yield, beginning with the highest dividend yield and progressively adding lower yielding stocks, as necessary. If there are insufficient stocks by adding nine year dividend growers, the EAFE Masters Index will then select stocks from the next year (i.e., eight years of dividend growth), beginning with the highest dividend yielding stock. This process is continued until all Index rules are satisfied.

In order to be included in the EAFE Masters Index, companies must first qualify for inclusion in MSCI EAFE. MSCI EAFE includes 85% of free float-adjusted, market capitalization in each industry group in developed market (as defined by MSCI) countries, excluding the U.S. and Canada. MSCI determines whether a country is a “developed market” country based on three criteria: economic development within the country (based on gross national income), size and liquidity (i.e., number of companies meeting certain size and liquidity standards in a given market) and market accessibility criteria (reflecting institutional investors’ experiences in investing in a given market). MSCI EAFE includes companies from Europe, Australasia and the Far East, and as of June 30, 2015, MSCI EAFE included companies from: Australia, Austria, Belgium, Denmark, Finland, France, Germany, Hong Kong, Ireland, Israel, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland and the United Kingdom. As of June 30, 2015, MSCI EAFE included companies with capitalizations between approximately \$1 billion and \$232.9 billion. The average capitalization of the companies comprising MSCI EAFE was approximately \$14.3 billion.

The EAFE Masters Index is published under the Bloomberg ticker symbol “M1EADMAR”.

### **ProShares High Yield–Interest Rated Hedged:**

The Citi High Yield (Treasury Rate-Hedged) Index, published by Citigroup Index LLC, is comprised of (a) USD-denominated high yield corporate bonds (high yield bonds) and (b) short exposure to U.S. Treasury notes or bonds (Treasury Securities) of, in the aggregate, approximate equivalent duration to the high yield bonds. In entering these positions, the Index seeks to achieve an overall effective duration of zero.

By taking the short positions, the Index seeks to mitigate the potential negative impact of rising Treasury interest rates (“interest rates”) on the performance of high yield bonds (conversely, limiting the potential positive impact of falling interest rates). The short positions are not intended to mitigate other factors influencing the price of high yield bonds, such as credit risk, which may have a greater impact than rising or falling

interest rates. Such other factors often impact high yield bond prices in an opposite way than interest rates, making it difficult to directly observe the impact of changes in interest rates on high yield bonds.

Relative to a long-only investment in the same high yield bonds, the Index should outperform in a rising interest rate environment and underperform in a falling or static interest rate environment. Performance of the Index could be particularly poor in risk-averse, flight-to-quality environments when it is common for high yield bonds to decline in value and for interest rates to fall. In addition, the performance of the Index, and by extension the Fund, depends on many factors beyond rising or falling interest rates, such as the perceived level of credit risk in the high yield bond positions. These factors may be as or more important to the performance of the Index than the impact of interest rates. As such, there is no guarantee that the Index, and accordingly, the Fund, will have positive performance even in environments of sharply rising interest rates. The Index may be more volatile than a long-only position in the same high yield bonds.

The long high yield bond positions included in the Index are designed to represent the more liquid universe of high yield bonds offered within the United States. Currently, the bonds eligible for inclusion in the Index include high yield bonds that are issued by companies domiciled in the U.S. and Canada, and that: are fixed rate (including callable bonds); have a maximum rating of Ba1/BB+ by both Moody's Investors Service, Inc. and Standard and Poor's Financial Services, LLC; and have a minimum of \$1 billion of face amount outstanding and must have been issued within the past five years. All eligible issues must have at least one year until maturity. Pay-in-kind (which allow the issuer the option of paying bondholders interest in additional securities or cash) and zero-coupon (which are sold at a discount to par value and on which interest payments are not made during the life of the security) bonds are excluded. No more than two issues from each issuer are allowed. In the event that an issuer has more than two issues that would be eligible for inclusion, the largest two issues by face value will be included. If there are multiple issues with the same face value outstanding, the most recently issued issues will be included. The Index is market value weighted with a two percent (2%) issuer cap. Index reconstitutions occur monthly—any bonds not meeting the stated criteria are deleted, any additional bonds meeting the criteria are added.

The short portion of the Index is composed of the two-, five- and ten-year Treasury notes that represent the current cheapest to deliver bond underlying the relevant two-, five- and ten-year futures contract; the allocation to the short positions is determined monthly and is designed to create a position that has an equal sensitivity to duration as the long high yield bond position.

### **ProShares Investment Grade–Interest Rated Hedged:**

The Citi Corporate Investment Grade (Treasury Rate-Hedged) Index, published by Citigroup Index LLC, is comprised of (a) long positions in USD-denominated investment grade corporate bonds issued by both U.S. and foreign domiciled companies; and (b) short exposure to U.S. Treasury notes or bonds (Treasury

Securities) of, in the aggregate, approximate equivalent duration to the investment grade bonds. In entering these positions, the Index seeks to achieve an overall effective duration of zero.

By taking short Treasury Security positions (of an aggregate dollar value not exceeding the aggregate dollar value of the Fund's assets), the Index seeks to mitigate the potential negative impact of rising Treasury interest rates (interest rates) on the performance of investment grade bonds (conversely, limiting the potential positive impact of falling interest rates). The short positions are not intended to mitigate other factors influencing the price of investment grade bonds, such as credit risk, which may have a greater impact than rising or falling interest rates. Such other factors may impact investment grade bond prices in an opposite way than interest rates, making it difficult to directly observe the impact of changes in interest rates on investment grade bonds.

Relative to a long-only investment in the same investment grade bonds, the Index should outperform in a rising interest rate environment and underperform in a falling or static interest rate environment. Performance of the Index could be particularly poor if investment grade credit deteriorates at the same time that Treasury interest rates fall. In addition, the performance of the Index, and by extension the Fund, depends on many factors beyond rising or falling interest rates, such as the perceived level of credit risk in the investment grade bond positions. These factors may be as or more important to the performance of the Index than the impact of interest rates. As such, there is no guarantee that the Index, and accordingly, the Fund, will have positive performance even in environments of sharply rising interest rates in which the short positions might be expected to mitigate the effect of such rises. The Index may be more volatile than a long-only position in the same investment grade bonds.

The long investment grade bond positions included in the Index are designed to represent the more liquid universe of investment grade bonds offered within the United States. Currently, the bonds eligible for inclusion in the Index include all investment grade bonds that are issued by U.S. and internationally domiciled companies that: are fixed rate; have a minimum rating of Baa3/BBB- by either Moody's Investors Service, Inc. (Moody's) or Standard and Poor's Financial Services, LLC (S&P); and have at least five and a half (5.5) years until maturity. Eligible bonds will also be screened for liquidity based on a minimum face amount outstanding of \$1 billion. The Index is market value weighted and caps the weight of any particular issuer at 3% of the Index. Index reconstitutions occur monthly—any bonds not meeting the stated criteria are deleted, any additional bonds meeting the criteria are added.

The short portion of the index is composed of a series of Treasury Securities that represent the current and least expensive to deliver bond underlying the relevant Treasury futures contract; the allocation to the short positions is determined monthly and is designed to create a position that has an equal sensitivity to duration as the long investment grade bond position.

### **ProShares Short Term USD Emerging Markets Bond ETF:**

The DB Short Duration Emerging Market Bond Index (Bloomberg Ticker: "DBEMPRO") is comprised of a diversified portfolio of

USD-denominated Emerging Market bonds that have less than or equal to five years remaining to maturity (“Short Term USD EM Bonds”) that are issued by Emerging Market sovereign governments (“Sovereigns”), non-sovereign government agencies and entities (“Sub-Sovereigns”), and corporations that the index provider determines have significant ownership (“Quasi-Sovereigns”). Those countries qualifying as “Emerging Markets” are determined by the index provider; as of June 30, 2015, the Index included bonds from Sovereigns or other qualifying entities domiciled in 23 such countries. These countries were: Brazil, Colombia, Croatia, El Salvador, Hungary, Indonesia, Latvia, Lithuania, Mexico, Pakistan, Panama, Peru, Philippines, Poland, Qatar, Russia, Serbia, Slovenia, South Africa, Sri Lanka, Turkey, Ukraine and Venezuela.

The Index is designed to represent the more liquid universe of Short Term USD EM Bonds. The bonds eligible for inclusion in the Index are expected to include those issued by Emerging Market Sovereigns, Sub-Sovereigns and Quasi-Sovereigns that: (1) are fixed rate; and (2) have between zero and five years to maturity. Eligible bonds will also have a minimum face amount outstanding of \$500 million. Callable, puttable, zero coupon, inflation-linked and convertible bonds, among others, will be excluded. The Index includes both investment grade and below investment grade rated (i.e. “high yield”) securities and will include bonds, in the aggregate, that have a dollar weighted average years-to-maturity of three years or less.

The Index limits issuers with weights greater than 4.5% to no more than 45% of the Index and limits the aggregate weight of issuers from any particular country to no more than ten percent (10%) of the Index. The Index is reconstituted and rebalanced on a quarterly basis; cash from maturing issues or coupon payments is reinvested monthly.

### ProShares Hedge Replication ETF:

ProShares Hedge Replication ETF has entered into a licensing agreement for the use of the Merrill Lynch Factor Model – Exchange Series (the “Benchmark”). ProShares Hedge Replication ETF seeks investment results, before fees and expenses, that track the performance of the Benchmark, which is a model established by Merrill Lynch International. The Benchmark seeks to provide the risk and return characteristics of the hedge fund asset class by targeting a high correlation to the HFRI Fund Weighted Composite Index (the “HFRI”). The HFRI is designed to reflect hedge fund industry performance through construction of an equally weighted composite of over 2000 constituent funds. In seeking to maintain a high correlation with the HFRI, the Benchmark utilizes a systematic regression model to establish, each month, weighted long or short (or, in certain cases, long or flat) positions in six underlying factors (“Factors”). The Benchmark does not in any way represent a managed hedge fund or group of hedge funds, and there is no guarantee that it will achieve returns correlated with any hedge fund, group of hedge funds, or the HFRI.

The Factors that comprise the Benchmark are the: (1) S&P 500 Total Return Index; (2) the MSCI EAFE US Dollar Net Total Return Index; (3) the MSCI Emerging Markets US Dollar Net Total Return

Index (“MSCI Emerging Markets”); (4) the Russell 2000 Total Return Index (“Russell 2000”); (5) three-month U.S. Treasury Bills; and (6) the ProShares UltraShort Euro ETF. Each of the Factors is weighted monthly from +100% to -100% (with the exception of the MSCI Emerging Markets, which is weighted between +100% and 0%, three-month U.S. Treasury Bills, which may be weighted between +200% and 0%, and the Russell 2000, which is weighted between +100% and -30%). For each monthly rebalancing, the systematic regression analysis seeks to determine which direction (i.e., long or short/flat) and weighting for each of the Factors over the previous 24 month period (ending on the month for which the most recent closing level of the HFRI is available) would have produced the highest correlation with the HFRI. The Factors are then weighted according to the results of the analysis. In no case will the sum of the factor weights (excluding three month U.S. Treasury Bills) be greater than +100% or less than -100%.

The Benchmark is published under the Bloomberg ticker symbol “MLEIFCTX.”

### ProShares Merger ETF:

ProShares Merger ETF has entered into a licensing agreement with Standard & Poor’s® for the use of the S&P Merger Arbitrage Index. The Index uses a quantitative methodology to track a dynamic basket of securities trading in global developed markets, including the U.S., generally representing long positions in certain securities of a target company (the “Target”), and in certain cases, short positions in securities of an acquiring company (the “Acquirer”) in order to provide exposure to the merger arbitrage strategy. The Index is comprised of cash-only, stock-only and “combination” mergers, acquisitions or other corporate reorganizations (i.e., those transactions that involve both cash and stock components) (together, such mergers, acquisitions and reorganizations, the “Deals”). For cash-only Deals, only a long position in the Target is taken. For stock-only and combination Deals, long positions are taken in the Target with an accompanying short position in the Acquirer based on the ratio of shares to be exchanged as part of the Deal. The Index does not include all possible Deals or any funds focused on merger and acquisition transactions. Types of Deals eligible for inclusion are mergers, acquisitions, private equity and leveraged buyout transactions, while minority interests and unit divestitures are excluded. Additions to the Index will be screened using several factors, including: (i) domicile of the company (i.e., the Target and Acquirer must be domiciled in: Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Hong Kong, Ireland, Italy, Japan, the Netherlands, New Zealand, Norway, Portugal, Singapore, Spain, Sweden, Switzerland, the United Kingdom and/ or the United States); (ii) Deal size (i.e., the total value of stock and/ or cash used to acquire the Target must be \$500 million or more; debt is not included); (iii) liquidity of the company (i.e., the Target or the Acquirer must have a three-month average daily trading value of \$2 million or more); (iv) Spread (i.e., the spread as of the time of the announcement must generally be two percent (2%) or more of the Target’s stock price); and (v) currency spreads (i.e., for Deals containing net foreign currency exposure, the Index will

exclude Deals in which the interest rate differential (the annualized forward discount or premium using the spot rate and one-month forward rate between the U.S. dollar and the other currency) exceeds certain thresholds). Deletions to the Index are based on several factors, including: (i) withdrawal of the Deal (i.e., the Deal is officially withdrawn, unless a Target is a target of two or more potential acquirers and at least one offer is still active); (ii) completion of the Deal; (iii) replacement of the Deal (as described below); and (iv) maximum inclusion time (i.e., a Target and Acquirer may be included in the Index for a maximum of one year).

Index additions and deletions are identified after 3:00 p.m. each trading day by S&P Dow Jones Indices LLC per eligibility criteria. Additions are made on the second business day following the announcement of a new Deal. A maximum of 40 Deals may be included, each with an initial three percent (3%) Index weight allocated to a long position in the Target. Short positions in the Acquirer are established in stock or partial stock Deals at the applicable ratio (e.g., if a Deal involves 100% stock, the amount allocated to a short position in the Acquirer would be 3%, or 100% of the initial 3% Index weight; however if a Deal involves 50% cash and 50% stock, the amount allocated to a short position in the Acquirer would be 1.5%, or 50% of the initial 3% Index weight). In no case shall any short position be greater than three percent (3%) when established. The Index may have initial long gross exposure of up to 120% so long as there is sufficient short exposure to ensure that the net position of the Index does not exceed 100% (i.e., is unlevered) each time a Deal is added. For example, if initially there are 40 eligible Deals, the Index will allocate three percent (3%) of its weight to a long position in each Target, provided there is at least 20% short gross exposure to Acquirers. If initially there is no short gross exposure to any Acquirer (i.e., each of the Deals is a cash-only Deal), then the maximum number of eligible Deals would be 33, as the Index will allocate three percent (3%) of its weight to each Target for maximum long exposure of 99% with the remaining amounts allocated to Treasury bills. The Index may initially have short gross exposure to Acquirers of up to 120% (i.e., each of the 40 Deals is a stock-for-stock Deal). Under such a scenario, the Index will allocate three percent (3%) of its weight to short positions in Acquirers. The Index will also allocate a corresponding three percent (3%) of its weight to long positions in each of the Targets. These initial minimum and maximum long and short gross exposures could increase or decrease due to fluctuations in the values of the Target and Acquirer stocks. If the Index has less than 40 Deals and a new Deal is added, that investment is made from cash reserves. If the Index reaches the maximum number of Deals (40) and a new Deal is eligible for addition, the current worst performing Deal is deleted from the Index and replaced by the new Deal. When a Deletion occurs without an accompanying new Deal, the assets from the deleted Deal will be held in cash reserves. Deletions will occur at the close of U.S. market trading with two days' notice.

### ProShares RAFI™ Long/Short:

The RAFI™ US Equity Long/Short Index seeks to utilize the Research Affiliates Fundamental Index (RAFI™) weighting

methodology to identify opportunities which are implemented through both long and short securities positions. The index compares RAFI™ constituent weightings to market capitalization (CAP) weights for a selection of U.S. domiciled publicly traded companies listed on major exchanges (the "Eligible Companies"). The index takes long positions in securities with larger RAFI™ weights relative to their CAP weights. Short positions are taken in securities with smaller RAFI™ weights relative to their CAP weights. The index methodology seeks to capitalize on a theory that traditional index weighting based on market capitalization results in over-weighting of overpriced securities and underweighting of underpriced securities. The index is rebalanced monthly such that it has equal dollar investments in both long and short positions and is reconstituted annually at which time new long and short positions are selected and weighted. Sector neutrality is also achieved during the annual reconstitution. The index at any time may have significant positive or negative correlations with long-only market capitalization-weighted indexes.

**Index Construction Summary** – The securities in the index are selected as of each annual reconstitution from a universe consisting of the 1000 largest Eligible Companies by market capitalization and the 1000 highest weighted Eligible Companies by RAFI™ weight (see RAFI™ methodology below). The companies included in the index are then selected for each of 10 industry sectors—within each sector, the 20% of the securities with the largest RAFI™ weights relative to their CAP weights are selected to comprise the long portfolio. The 20% of securities within each sector with the smallest RAFI™ weights relative to their CAP weights are selected to comprise the short portfolio.

Weights are assigned to individual constituents in relation to both the absolute and proportional difference between their RAFI™ and CAP weights. Weights are then normalized within each sector so that the resulting sector weights in both the long and short portfolios match the model sector weights of a hypothetical RAFI™ weighted US 1000 long only index.

**RAFI™ Methodology** – The index is based on the RAFI™ methodology for selecting and weighting securities based on measures of company size including sales, cash flow, dividends and book value.

The starting universe consists of a Research Affiliates universe of publically traded US companies listed on major US stock exchanges (the "RA Universe"). For each company within this RA Universe, an aggregation of historical accounting data (consisting of sales, cash flow and dividends) and current book value is selected. Five-year averages are then calculated for each company for sales, cash flow and dividends, while current book value acts as a fourth variable. Each of the four measures is equal weighted.

From this data, a composite RAFI™ weight is calculated for each company. Composite fundamental weights are comprised of individual RAFI™ weights calculated for each company for each individual accounting variable. Each corporation thereby receives a composite RAFI™ weight equal to the ratio of its sales (or cash flow, dividends, book value) to the aggregate sales (or cash flow, dividends, book value) across all companies in the sample. If a company does not pay any dividends, the composite calculation does not give it a zero weight on that metric but computes its weight as

an equally weighted average of the remaining three metrics. Companies that receive a negative composite weight are removed.

### **ProShares UltraShort Gold Miners and ProShares Ultra Gold Miners:**

The NYSE Arca Gold Miners Index (the Index) is a modified market-capitalization weighted index primarily comprised of publicly traded companies involved in the mining of gold and silver. The Index includes common stocks, ADRs and GDRs of selected companies that are involved in mining of gold and silver and that are listed for trading and electronically quoted on a major stock market that is accessible by foreign investors. Only companies with market capitalizations greater than \$750 million that have an average daily volume of at least 50,000 shares over the past three months and an average daily value traded of at least \$1 million over the past three months are eligible for inclusion in the Index. The weight of companies whose revenues are more significantly exposed to silver mining will not exceed 20% of the Index at rebalance.

As of June 30, 2015, the Index included 40 securities of companies with a market capitalization range of between approximately \$70.6 million and \$13.4 billion and an average market capitalization of \$2.9 billion. These amounts are subject to change.

The Index is weighted based on the market capitalization of each of the component securities, modified to conform to the following asset diversification requirements, which are applied in conjunction with the scheduled quarterly adjustments to the Index:

- (1) the weight of any single component security may not account for more than 20% of the total value of the Index;
- (2) the component securities are split into two subgroups—large and small, which are ranked by market capitalization weight in the Index. Large stocks are defined as having a starting Index weight greater than or equal to 5%. Small securities are defined as having a starting Index weight below 5%. The large group and small group will represent 45% and 55%, respectively, of the Index; and
- (3) the final aggregate weight of those component securities which individually represent more than 4.5% of the total value of the Index may not account for more than 45% of the total Index value. The information utilized in this modification process is taken from the close of trading on the second Friday of the rebalance month. The Index is reviewed quarterly so that the Index components continue to represent the universe of companies involved in the gold mining industry. Companies will be removed from the Index if the market capitalization is lower than \$450 million or the average daily volume for the past three months is lower than 30,000 shares and the average daily value traded for the past three months is lower than \$600,000. The NYSE may at any time and from time to time change the number of securities comprising the group by adding or deleting one or more securities, or replacing one or more securities contained in the group with one or more substitute securities of its choice, if in the NYSE's discretion such addition, deletion or substitution is necessary or appropriate to maintain the

quality and/or character of the Index. Changes to the Index compositions and/or the component share weights in the Index typically take effect after the close of trading on the third Friday of each calendar quarter month in connection with the quarterly index rebalance.

### **ProShares UltraShort Junior Miners and ProShares Ultra Junior Miners:**

The Market Vectors Global Junior Gold Miners Index (the Index) is a rules based, modified capitalization weighted, float adjusted index intended to give investors a means of tracking the overall performance of micro- and small-capitalization companies that are involved primarily in the mining of gold and/or silver. To be eligible for the Index, companies must generate at least 50% of their revenues from (or, in certain circumstances, have at least 50% of their revenues related to) gold and/or silver mining or have mining projects with the potential to generate at least 50% of their revenues from gold and/or silver when developed. The weight of companies determined to be “silver” stocks will not exceed 20% of the Index at any quarterly rebalance. Between rebalances, however, the weight may exceed 20% due to market appreciation. The target coverage for the Index is 100% of the free-float market capitalization of the investable small-cap universe with at least 25 companies.

Constituent stocks of the Index must have a market capitalization of greater than \$150 million as of the end of the month prior to the month in which a rebalancing date occurs to be eligible for the Index. Stocks whose market capitalizations fall below \$75 million as of the end of the month prior to the month in which any rebalancing date occurs will no longer be eligible for the Index. Stocks must have a three-month average daily trading volume value of at least \$1 million to be eligible for the Index and issuers of such stocks must have traded at least an average of 250,000 shares per month over the last six months. Only shares that trade on a recognized domestic or international stock exchange may qualify.

As of June 30, 2015, the Index included 57 securities of companies with a market capitalization range of between approximately \$79.7 million and \$1.6 billion and an average market capitalization of \$537.4 million. These amounts are subject to change.

The Index is the exclusive property of MVIS (a wholly owned subsidiary of the Adviser), which has contracted with Solactive AG to maintain and calculate the Index. Solactive AG uses its best efforts to ensure that the Index is calculated correctly. Irrespective of its obligations towards MVIS, Solactive AG has no obligation to point out errors in the Index to third parties. ProShares UltraShort Junior Miners and ProShares Ultra Junior Miners are not sponsored, endorsed, sold or promoted by MVIS and MVIS makes no representation regarding the advisability of investing in ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners.

The Index is calculated using a capitalization weighting methodology, adjusted for float, which is modified so as to facilitate compliance with the diversification requirements of Subchapter M of the Internal Revenue Code. The Index is reconstituted quarterly, at

the close of business on the third Friday in a quarter-end month (i.e., March, June, September and December) and companies are added and/or deleted based upon the Index eligibility criteria. Companies with recent stock exchange listings, i.e., recent initial public offerings, may be added to the Index on a quarterly basis, provided the companies meet all eligibility criteria and have been trading for more than 30 trading days. The share weights of the Index components are adjusted also on a quarterly basis (every third Friday in a quarter end month).

### Citigroup Index LLC

Citigroup Index LLC ("Citigroup Index") is not affiliated with ProShare Advisors, the Trust or ProShares High Yield–Interest Rate Hedged and ProShares Investment Grade–Interest Rate Hedged (together, the "Funds"). The Funds are not sponsored, endorsed, sold or promoted by Citigroup Index or any of its affiliates. Citigroup Index makes no representation or warranty, express or implied, to the owners or prospective owners of shares of the Funds or any member of the public regarding the advisability of investing in securities generally or in the Funds particularly, or the ability of the Funds to track the price and yield performance of the Citi High Yield (Treasury Rate-Hedged) Index and the Citi Corporate Investment Grade (Treasury Rate Hedged) Index (together, the "Indexes") or the ability of the Indexes to track general bond market performance. Citigroup Index's only relationship to ProShares Trust ("Licensee") is the licensing of certain information, data, trademarks and trade names of Citigroup or its affiliates. The Indexes are determined, composed and calculated by Citigroup Index without regard to Licensee or the Funds. Citigroup Index has no obligation to take the needs of Licensee or the owners or prospective owners of the Funds into consideration in determining, composing or calculating the Indexes. Citigroup Index is not responsible for and has not participated in the determination of the prices and amount of the shares to be issued by the Funds or the timing of the issuance or sale of the shares to be issued by the Funds or in the determination or calculation of the equation by which the shares to be issued by the Funds are to be converted into cash. Citigroup Index has no obligation or liability in connection with the administration, marketing or trading of the Funds.

CITIGROUP INDEX DOES NOT GUARANTEE THE ACCURACY OR COMPLETENESS OF THE INDEXES OR ANY DATA INCLUDED THEREIN, OR FOR ANY COMMUNICATIONS, INCLUDING BUT NOT LIMITED TO, ORAL OR WRITTEN COMMUNICATIONS (INCLUDING ELECTRONIC COMMUNICATIONS) WITH RESPECT THERETO, AND CITIGROUP INDEX SHALL HAVE NO LIABILITY FOR ANY ERRORS, OMISSIONS OR DELAYS THEREIN. CITIGROUP INDEX MAKES NO WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY LICENSEE, OWNERS OR PROSPECTIVE OWNERS OF SHARES

OF THE FUNDS, OR ANY OTHER PERSON OR ENTITY FROM THE USE OF THE INDEXES OR ANY DATA INCLUDED THEREIN. CITIGROUP INDEX MAKES NO EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIMS ALL WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE WITH RESPECT TO THE INDEXES OR ANY DATA INCLUDED THEREIN. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL CITIGROUP INDEX HAVE ANY LIABILITY FOR ANY DIRECT, SPECIAL, PUNITIVE, INDIRECT, CONSEQUENTIAL OR ANY OTHER DAMAGES (INCLUDING LOST PROFITS), EVEN IF NOTIFIED OF THE POSSIBILITY OF SUCH DAMAGES, WHETHER IN CONTRACT, TORT, STRICT LIABILITY OR OTHERWISE.

### Credit Suisse

#### ***ProShares Large Cap Core Plus***

The Credit Suisse Large Cap 130/30 Index was developed by Credit Suisse Securities (USA) LLC and its affiliates (collectively, "Credit Suisse") in collaboration with AlphaSimplex Group, LLC ("AlphaSimplex"). The Index is managed by an Index Committee chaired by Dr. Andrew Lo, Chairman and Chief Scientific Officer of AlphaSimplex, and Harris & Harris Group Professor at the MIT Sloan School of Management. The Committee Vice Chairman is Mr. Pankaj Patel, Director of Quantitative Research at Credit Suisse. About Credit Suisse: As one of the world's largest banks, Credit Suisse provides its clients with investment banking, private banking and asset management services worldwide. Credit Suisse offers advisory services, solutions and products to companies, institutional clients and high-net-worth private clients globally, as well as retail clients in Switzerland. Credit Suisse is active in over 50 countries and employs approximately 45,000 people. Credit Suisse's parent company, Credit Suisse Group, is a global financial services company headquartered in Zurich. Credit Suisse Group's registered shares (CSGN) are listed in Switzerland and, in the form of American Depositary Shares (CS), in New York. Further information about Credit Suisse can be found at [www.credit-suisse.com](http://www.credit-suisse.com)

About AlphaSimplex: Founded in 1999 by Dr. Andrew W. Lo, AlphaSimplex is an SEC-registered investment advisory firm based in Cambridge, Massachusetts specializing in quantitative global macro and global tactical asset allocation strategies, beta-replication products, and absolute-return risk analytics. It is a wholly-owned subsidiary of Natixis Global Asset Management, LLC. Additional information about AlphaSimplex can be found at [www.alphasimplex.com](http://www.alphasimplex.com). "Credit Suisse" and the index are service marks of Credit Suisse. Credit Suisse do not sponsor, endorse or promote the Fund, recommend that any person invest or trade in the Fund or any other securities, have any responsibility or liability for or make any decisions about the timing, amount or pricing of the Fund, have any responsibility or liability for the administration or management of the Fund and consider the needs of the Fund or the shareholders of the Fund in determining, composing or calculating the index or have any obligation to do so. Credit Suisse may discontinue the index or change the index or its compilation and composition at any time, in its sole discretion, without regard to any impact thereof on the Fund.

CREDIT SUISSE DOES NOT GUARANTEE THE ACCURACY OR COMPLETENESS OF THE INDEX OR ANY DATA INCLUDED THEREIN AND CREDIT SUISSE SHALL HAVE NO LIABILITY FOR ANY ERRORS, OMISSIONS OR INTERRUPTIONS THEREIN. CREDIT SUISSE MAKES NO WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY THE FUND, OR BY ANY OTHER PERSON OR ENTITY FROM THE USE OF THE INDEX OR ANY DATA INCLUDED THEREIN. CREDIT SUISSE MAKES NO EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIMS ALL WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE WITH RESPECT TO THE INDEX OR ANY DATA INCLUDED THEREIN.

Credit Suisse will not have any liability in connection with the Fund. Specifically,

- Credit Suisse does not make any representation or warranty, express, statutory or implied, and Credit Suisse disclaims any representation or warranty about:
  - The results to be obtained by the Fund, the shareholders of the Fund or any other person in connection with the use of the index and the data related to the index;
  - The accuracy or completeness of the index or its related data;
  - The merchantability and the fitness for a particular purpose or use of the index or its related data.
- Credit Suisse will have no liability for any errors, omissions or interruptions in the index or its related data.
- Under no circumstances and under no theory of law (whether tort, contract, strict liability or otherwise) will Credit Suisse be liable for any lost profits or direct, indirect, punitive, special or consequential damages or losses, even if Credit Suisse knows that they might occur.

### ***ProShares 30 Year TIPS/TSY Spread***

“Credit Suisse” and “Credit Suisse 30-Year Inflation Breakeven Index” are service marks of Credit Suisse First Boston Data And Analytics, LLC or one of its affiliates (collectively, “Credit Suisse”). Credit Suisse has no relationship to ProShares 30 Year TIPS/TSY Spread (the “Product”) other than the licensing of the Credit Suisse 30-Year Inflation Breakeven Index and its service mark for use in connection with the Product and is not a party to any transaction contemplated hereby.

The rules of the Credit Suisse 30-Year Inflation Breakeven Index may be amended by Credit Suisse (the “Index Creator”). An amendment to the rules may result from, without limitation, a change to the construction or calculation rules for the Index or from the Index Creator determining that a change to the rules is required or desirable in order to update them or to address an error, omission or ambiguity. No assurance can be given that any such amendment would not be prejudicial to the investors.

The end-of-day values of the Credit Suisse 30-Year Inflation Breakeven Index are published subject to the provisions in the rules of the Index. Neither the Index Creator nor any of its affiliates is obliged to publish any information regarding the Index other than as stipulated in the rules of the Index.

The Product is not in any way sponsored, endorsed, sold or promoted by Credit Suisse and/or any of its affiliates and neither Credit Suisse, nor any of their affiliates makes any warranty or representation whatsoever, expressly or impliedly, either as to the results to be obtained from the use of the Credit Suisse 30-Year Inflation Breakeven Index, the figures at which the Index stands at any particular time on any particular day or otherwise, or the advisability of or results to be obtained by investing in or trading the Product. The Index is compiled, maintained and calculated by Credit Suisse. However, Credit Suisse shall not be liable (whether in negligence or otherwise) to any person for any error in the Index and Credit Suisse shall not be under any obligation to advise any person of any error therein.

Neither Credit Suisse, nor any of their affiliates have published or approved this document and accept no responsibility for its contents or use.

### **DISCLAIMER**

The Indexes are the exclusive property of Credit Suisse First Boston Data And Analytics, LLC, and/or any of its affiliates. The Products are not in any way sponsored, endorsed or promoted by Credit Suisse and/or any of its affiliates. Neither Credit Suisse, nor any of its affiliates has any obligation to take the needs of any person into consideration in composing, determining or calculating the Indexes (or causing the Indexes to be calculated). In addition, neither Credit Suisse, nor any of its affiliates makes any warranty or representation whatsoever, express or implied, as to the results to be obtained from the use of the Indexes and/or the level at which the Indexes stand at any particular time on any particular day or otherwise, and neither Credit Suisse, nor any of its affiliates shall be liable, whether in negligence or otherwise, to any person for any errors or omissions in an Index or in the calculation of an Index or under any obligation to advise any person of any errors or omissions therein.

### **Deutsche Bank AG**

“Deutsche Bank” and “DB Short Duration Emerging Market Bond Index<sup>SM</sup>” are service marks of Deutsche Bank AG and have been licensed for use for certain purposes by ProShares Trust. ProShares Short Term USD Emerging Markets Bond ETF (the “Product”) has not been passed on by Deutsche Bank AG as to its legality or suitability. The Product is not sponsored, endorsed, sold or promoted by Deutsche Bank AG, and Deutsche Bank makes no representation, express or implied, regarding the advisability of investing in the Product. DEUTSCHE BANK AG AND ITS AFFILIATES MAKE NO WARRANTIES AND BEAR NO LIABILITY WITH RESPECT TO THE PRODUCT.

The Product is not sponsored, endorsed, sold or promoted by Deutsche Bank AG or any subsidiary or affiliate of Deutsche Bank AG. The DB Short Duration Emerging Market Bond Index (the “DB Index”) is the exclusive property of Deutsche Bank AG. “Deutsche Bank” and “DB Short Duration Emerging Market Bond Index” are service marks of Deutsche Bank AG and have been licensed for use for certain purposes by ProShares Trust. Neither Deutsche Bank AG, any affiliate of Deutsche Bank AG nor any other party involved in, or related to, making or compiling the DB

Index makes any representation or warranty, express or implied, concerning the DB Index, the Product or the advisability of investing in securities generally. Neither Deutsche Bank AG, any affiliate of Deutsche Bank AG nor any other party involved in, or related to, making or compiling the DB Index has any obligation to take the needs of ProShares Short Term USD Emerging Markets Bond ETF (the Product), the sponsor of the Product, or its clients into consideration in determining, composing or calculating the DB Index. Neither Deutsche Bank AG, any affiliate of Deutsche Bank AG nor any other party involved in, or related to, making or compiling the DB Index is responsible for or has participated in the determination of the timing of, prices at, quantities or valuation of the Product. Neither Deutsche Bank AG, any affiliate of Deutsche Bank AG nor any other party involved in, or related to, making or compiling the DB Index has any obligation or liability in connection with the administration, marketing or trading of the Product.

NEITHER DEUTSCHE BANK AG, ANY AFFILIATE OF DEUTSCHE BANK AG NOR ANY OTHER PARTY INVOLVED IN, OR RELATED TO, MAKING OR COMPILING THE DB INDEX WARRANTS OR GUARANTEES THE ACCURACY AND/OR THE COMPLETENESS OF THE DB INDEX OR ANY DATA INCLUDED THEREIN AND SHALL HAVE NO LIABILITY FOR ANY ERRORS, OMISSIONS, OR INTERRUPTIONS THEREIN. NEITHER DEUTSCHE BANK AG, ANY AFFILIATE OF DEUTSCHE BANK AG NOR ANY OTHER PARTY INVOLVED IN, OR RELATED TO, MAKING OR COMPILING THE DB INDEX MAKES ANY WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY PROSHARES SHORT TERM USD EMERGING MARKETS BOND ETF FROM THE USE OF THE DB INDEX OR ANY DATA INCLUDED THEREIN. NEITHER DEUTSCHE BANK AG, ANY AFFILIATE OF DEUTSCHE BANK AG NOR ANY OTHER PARTY INVOLVED IN, OR RELATED TO, MAKING OR COMPILING THE DB INDEX MAKES ANY EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIMS ALL WARRANTIES, OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE WITH RESPECT TO THE DB INDEX OR ANY DATA INCLUDED THEREIN. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL DEUTSCHE BANK AG, ANY AFFILIATE OF DEUTSCHE BANK AG OR ANY OTHER PARTY INVOLVED IN, OR RELATED TO, MAKING OR COMPILING THE DB INDEX HAVE ANY LIABILITY FOR DIRECT, INDIRECT, PUNITIVE, SPECIAL, CONSEQUENTIAL OR ANY OTHER DAMAGES OR LOSSES (INCLUDING LOST PROFITS), EVEN IF NOTIFIED OF THE POSSIBILITY THEREOF. THERE ARE NO THIRD PARTY BENEFICIARIES OF ANY AGREEMENTS OR ARRANGEMENTS BETWEEN DEUTSCHE BANK AG AND PROSHARES TRUST.

No purchaser, seller or holder of this security, or any other person or entity, should use or refer to any Deutsche Bank trade name, trademark or service mark to sponsor, endorse, market or promote this product without first contacting Deutsche Bank to determine whether Deutsche Bank's permission is required. Under no circumstances may any person or entity claim any affiliation with Deutsche Bank without the written permission of Deutsche Bank.

## FTSE

ProShares Ultra, Short and UltraShort FTSE China 50 and ProShares Ultra and UltraShort FTSE Developed Europe Hedged FTSE Europe ETF and Hedged FTSE Japan ETF are not in any way sponsored, endorsed, sold or promoted by FTSE International Limited ("FTSE") or by the London Stock Exchange Group Companies ("LSEG") (together the "Licensor Parties") and none of the Licensor Parties make any claim, prediction, warranty or representation whatsoever, expressly or impliedly, either as to (i) the results to be obtained from the use of the FTSE China 50 Index FTSE Developed Europe 100% Hedged to USD Index, FTSE Japan 100% Hedged to USD Index and the FTSE Developed Europe Index<sup>®</sup> (the "Indexes") (ii) the figure at which the Indexes are said to stand at any particular time on any particular day or otherwise, or (iii) the suitability of the Indexes for the purpose to which they are being put in connection with the ProShares Ultra, Short and UltraShort FTSE China 50 and the ProShares Ultra and UltraShort FTSE Developed Europe Hedged FTSE Europe ETF and Hedged FTSE Japan ETF. None of the Licensor Parties have provided or will provide any financial or investment advice or recommendation in relation to the Index to ProShares or its clients. The Indexes are calculated by FTSE or its agent. None of the Licensor Parties shall be (a) liable (whether in negligence or otherwise) to any person for any error in the Index and (b) under any obligation to advise any person of any error therein.

All rights in the Index vest in FTSE. "FTSE<sup>®</sup>" is a trademark of the LSEG and is used by FTSE under license.

## LPX AG (LPX)

LPX AG (LPX), the Index licensor, is not affiliated with ProShare Advisors, the Trust or the Fund. LPX<sup>®</sup> Direct Listed Private Equity Index<sup>®</sup> and "LPX<sup>®</sup>" are registered trademarks of LPX and have been licensed for use by ProShares. ProShares have not been passed on by LPX or any of its affiliates as to their legality or suitability. LPX makes no representation or warranty, express or implied, to the owners of the Fund or any member of the public regarding the advisability of investing securities generally or in the Fund particularly, or the ability of the Index to track general market performance. The Index is determined, composed and calculated by LPX without regard to the Trust or the Fund. LPX has no obligation to take the needs of the Trust or the Fund into consideration in determining, composing or calculating the Index. There is no assurance that investment products based on the Index will accurately track Index performance or provide positive investment returns. Inclusion of a security within the Index is not a recommendation by LPX to buy, sell or hold such security, nor is it investment advice. ProShares based on the LPX<sup>®</sup> Direct Listed Private Equity Index are not issued, created, sponsored, endorsed, sold, or promoted by LPX, and it makes no representation regarding the advisability of investing in ProShares. **LPX AND ITS AFFILIATES MAKE NO WARRANTIES AND BEAR NO LIABILITY WITH RESPECT TO PROSHARES.**

## Market Vectors Index Solutions GmbH

The Product is not sponsored, endorsed, sold or promoted by Market Vectors Index Solutions GmbH ("Licensor"). Licensor

makes no representation or warranty, express or implied, to the owners of ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners or any member of the public regarding the advisability of investing in securities generally or in ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners particularly or the ability of the Market Vectors™ Junior Gold Miners Index (“Market Vector Index”) to track the performance of the physical commodities market. Licensor’s only relationship to the Licensee is the licensing of certain service marks and trade names of Licensor and of the Market Vector Index that is determined, composed and calculated by Licensor without regard to the Licensee or ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners. Licensor has no obligation to take the needs of the Licensee or the owners of ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners into consideration in determining, composing or calculating the Market Vector Index. Licensor is not responsible for and has not participated in the determination of the timing of, prices at, or quantities of ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners to be issued or in the determination or calculation of the equation by which ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners is to be converted into cash. Licensor has no obligation or liability in connection with the administration, marketing or trading of ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners.

LICENSOR DOES NOT GUARANTEE THE ACCURACY AND/OR THE COMPLETENESS OF THE MARKET VECTOR INDICES OR ANY DATA INCLUDED THEREIN AND LICENSOR SHALL HAVE NO LIABILITY FOR ANY ERRORS, OMISSIONS, OR INTERRUPTIONS THEREIN. LICENSOR MAKES NO WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY LICENSEE, OWNERS OF PROSHARES ULTRASHORT JUNIOR MINERS OR PROSHARES ULTRA JUNIOR MINERS, OR ANY OTHER PERSON OR ENTITY FROM THE USE OF THE MARKET VECTOR INDICES OR ANY DATA INCLUDED THEREIN. LICENSOR MAKES NO EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIMS ALL WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE WITH RESPECT TO THE MARKET VECTOR INDICES OR ANY DATA INCLUDED THEREIN. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL LICENSOR HAVE ANY LIABILITY FOR ANY SPECIAL, PUNITIVE, INDIRECT, OR CONSEQUENTIAL DAMAGES (INCLUDING LOST PROFITS), EVEN IF NOTIFIED OF THE POSSIBILITY OF SUCH DAMAGES.

ProShares UltraShort Junior Miners and ProShares Ultra Junior Miners are not sponsored, promoted, sold or supported in any other manner by Structured Solutions AG nor does Structured Solutions AG offer any express or implicit guarantee or assurance either with regard to the results of using the Index and/or Index trade mark or the Index Price at any time or in any other respect. The Index is calculated and published by Structured Solutions AG. Structured Solutions AG uses its best efforts to ensure that the Index is calculated correctly. Irrespective of its obligations towards the Issuer, Structured Solutions AG has no obligation to point out errors in the Index to third parties including but not limited to investors and/or financial intermediaries of the

financial instrument. Neither publication of the Index by Structured Solutions AG nor the licensing of the Index or Index trade mark for the purpose of use in connection with the financial instrument constitutes a recommendation by Structured Solutions AG to invest capital in said financial instrument nor does it in any way represent an assurance or opinion of Structured Solutions AG with regard to any investment in this financial instrument. Structured Solutions AG is not responsible for fulfilling the legal requirements concerning the accuracy and completeness of the financial instrument’s prospectus.

ProShares UltraShort Junior Miners and ProShares Ultra Junior Miners are not sponsored, endorsed, sold or promoted by Van Eck Associates Corporation (“Van Eck”). Van Eck makes no representation or warranty, express or implied, nor accepts any responsibility, regarding the accuracy or completeness of this Prospectus, or the advisability of investing in securities or financial instruments, or in ProShares UltraShort Junior Miners or ProShares Ultra Junior Miners.

VAN ECK AND ITS AFFILIATES SHALL NOT HAVE ANY LIABILITY FOR ANY ERRORS, OMISSIONS, OR INTERRUPTIONS, AND MAKES NO WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY OWNERS OF, PROSHARES ULTRASHORT JUNIOR MINERS OR PROSHARES ULTRA JUNIOR MINERS, OR ANY OTHER PERSON OR ENTITY FROM THE USE OF PROSHARES ULTRASHORT JUNIOR MINERS OR PROSHARES ULTRA JUNIOR MINERS. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL VAN ECK OR ANY OF ITS AFFILIATES HAVE ANY LIABILITY FOR ANY LOST PROFITS OR INDIRECT, PUNITIVE, SPECIAL OR CONSEQUENTIAL DAMAGES OR LOSSES, EVEN IF NOTIFIED OF THE POSSIBILITY THEREOF.

### Markit iBoxx

“iBoxx” is a registered trademark of Markit Indices Limited (“Markit”) and is licensed for use by ProShares Trust. ProShares have not been passed on by these entities or their affiliates as to their legality or suitability. Markit does not approve, sponsor, endorse or recommend ProShares Trust or the Funds. Markit makes no representation regarding the advisability of investing in the Funds. The Funds are derived from a source considered reliable, but Markit and its employees, suppliers, subcontractors and agents (together “Markit Associates”) do not guarantee the veracity, completeness or accuracy of the Funds or other information furnished in connection with the Funds. No representation, warranty or condition, express or implied, statutory or otherwise, as to condition, satisfactory quality, performance, or fitness for purpose are given or assumed by Markit or any of the Markit Associates in respect of 1) an iBoxx Index, Funds, or any data included in it, 2) the use by any person or entity of the Funds of that data, 3) the results obtained from the use of any iBoxx Index 4) the creditworthiness of any entity, or the likelihood of the occurrence of a credit event or similar event (however defined) with respect to an obligation, in an iBoxx Index at any particular time on any particular date or otherwise, or 5) the ability of an iBoxx Index to track relevant markets’ performances or otherwise relating to an iBoxx Index or any transaction or product with

respect thereto. All such representations, warranties and conditions are excluded save to the extent that such exclusion is prohibited by law.

No party purchasing or selling Fund nor the Markit Associates shall have any liability to any party for any act or failure to act by the Index Sponsor in connection with the determination, adjustment, calculation or maintenance of the Index.

### **Markit North America, Inc.**

The Markit iBoxx EUR Germany Sovereign & Sub-Sovereign Liquid Index (the “Index”) referenced herein is the property of Markit North America, Inc. (“Index Sponsor”) and has been licensed for use in connection with ProShares German Sovereign/Sub-Sovereign ETF. Each party acknowledges and agrees that ProShares German Sovereign/Sub-Sovereign ETF is not sponsored, endorsed or promoted by the Index Sponsor. The Index Sponsor makes no representation whatsoever, whether express or implied, and hereby expressly disclaims all warranties (including, without limitation, those of merchantability or fitness for a particular purpose or use), with respect to the Index or any data included therein or relating thereto, and in particular disclaims any warranty either as to the quality, accuracy and/or completeness of the Index or any data included therein, the results obtained from the use of the Index and/or the creditworthiness of any entity, or the likelihood of the occurrence of a credit event or similar event (however defined) with respect to an obligation, in the Index at any particular time on any particular date or otherwise. The Index Sponsor shall not be liable (whether in negligence or otherwise) to the parties or any other person for any error in the Index, and the Index Sponsor is under no obligation to advise the parties or any person of any error therein.

The Index Sponsor makes no representation whatsoever, whether express or implied, as to the advisability of purchasing or selling ProShares German Sovereign / Sub-Sovereign ETF, the ability of the Index to track relevant markets’ performances or otherwise relating to the Index or any transaction or product with respect thereto, or of assuming any risks in connection therewith. The Index Sponsor has no obligation to take the needs of any party into consideration in determining, composing or calculating the Index. No party purchasing or selling ProShares German Sovereign / Sub-Sovereign ETF, nor the Index Sponsor shall have any liability to any party for any act or failure to act by the Index Sponsor in connection with the determination, adjustment, calculation or maintenance of the Index. The Index Sponsor and its affiliates may deal in any obligations that compose the Index, and may, where permitted, accept deposits from, make loans or otherwise extend credit to, and generally engage in any kind of commercial or investment banking or other business with the issuers of such obligations or their affiliates, and may act with respect to such business as if the Index did not exist, regardless of whether such action might adversely affect the Index or ProShares German Sovereign/Sub-Sovereign ETF.

### **Morningstar**

ProShares Morningstar Alternatives Solution ETF (the Fund) is not sponsored, endorsed, sold or promoted by Morningstar, Inc.

Morningstar makes no representation or warranty, express or implied, to the owners of the Fund or any member of the public regarding the advisability of investing in securities generally or in the Fund in particular or the ability of the Morningstar® Diversified Alternatives Index<sup>SM</sup> (the Index) to track general stock market performance. Morningstar’s only relationship to ProShares Trust is the licensing of: (i) certain service marks and service names of Morningstar; and (ii) the Index which is determined, composed and calculated by Morningstar without regard to ProShares Trust or the Fund. Morningstar has no obligation to take the needs of ProShares Trust or the owners of the Fund into consideration in determining, composing or calculating the Index. Morningstar is not responsible for and has not participated in the determination of the prices and amount of the Index or the timing of the issuance or sale of the Fund or in the determination or calculation of the equation by which the Fund is converted into cash. Morningstar has no obligation or liability in connection with the administration, marketing or trading of the Fund.

MORNINGSTAR, INC., DOES NOT GUARANTEE THE ACCURACY AND/OR THE COMPLETENESS OF THE FUND OR ANY DATA INCLUDED THEREIN AND MORNINGSTAR SHALL HAVE NO LIABILITY FOR ANY ERRORS, OMISSIONS, OR INTERRUPTIONS THEREIN. MORNINGSTAR MAKES NO WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY PROSHARES TRUST, OWNERS OR USERS OF THE FUND, OR ANY OTHER PERSON OR ENTITY FROM THE USE OF THE FUND OR ANY DATA INCLUDED THEREIN. MORNINGSTAR MAKES NO EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIMS ALL WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE WITH RESPECT TO THE FUND OR ANY DATA INCLUDED THEREIN. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL MORNINGSTAR HAVE ANY LIABILITY FOR ANY SPECIAL, PUNITIVE, INDIRECT, OR CONSEQUENTIAL DAMAGES (INCLUDING LOST PROFITS), EVEN IF NOTIFIED OF THE POSSIBILITY OF SUCH DAMAGES.

### **MSCI**

ProShares MSCI EAFE Dividend Growers ETF, ProShares Ultra, Short and UltraShort MSCI EAFE, ProShares Ultra, Short and UltraShort MSCI Emerging Markets, ProShares Ultra and UltraShort MSCI Pacific ex-Japan, ProShares Ultra and UltraShort MSCI Brazil Capped, ProShares Ultra and UltraShort MSCI Japan, ProShares Ultra and UltraShort MSCI Mexico Capped IMI (the “MSCI Funds”) are not sponsored, endorsed, sold or promoted by MSCI Inc. (“MSCI”), any of its affiliates, any of its information providers or any other third party involved in, or related to, compiling, computing or creating any MSCI index (collectively, the “MSCI Parties”). The MSCI indexes are the exclusive property of MSCI. MSCI and the MSCI index names are service marks of MSCI or its affiliates and have been licensed for use for certain purposes by the Trust. None of the MSCI Parties makes any representation or warranty, express or implied, to the issuer or shareholders of the MSCI Funds or any other person or entity regarding the advisability of investing in the MSCI Funds generally or in the MSCI Funds particularly or the ability of any MSCI index to track corresponding

stock market performance. MSCI or its affiliates are the licensors of certain trademarks, service marks and trade names and of the MSCI indexes which are determined, composed and calculated by MSCI without regard to the MSCI Funds or the issuer or shareholders of the MSCI Funds or any other person or entity into consideration in determining, composing or calculating the MSCI indexes. None of the MSCI Parties is responsible for or has participated in the determination of the timing of, prices at, or quantities of the MSCI Funds to be issued or in the determination or calculation of the equation by or the consideration into which the MSCI Funds are redeemable. Further, none of the MSCI Parties has any obligation or liability to the issuer or owners of the MSCI Funds or any other person or entity in connection with the administration, marketing or offering of the MSCI Funds.

ALTHOUGH MSCI SHALL OBTAIN INFORMATION FOR INCLUSION IN OR FOR USE IN THE CALCULATION OF THE MSCI INDEXES FROM SOURCES THAT MSCI CONSIDERS RELIABLE, NONE OF THE MSCI PARTIES WARRANTS OR GUARANTEES THE ORIGINALITY, ACCURACY AND/OR THE COMPLETENESS OF ANY MSCI INDEX OR ANY DATA INCLUDED THEREIN. NONE OF THE MSCI PARTIES MAKES ANY WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY THE ISSUER OF THE MSCI FUNDS, SHAREHOLDERS OF THE MSCI FUNDS, OR ANY OTHER PERSON OR ENTITY, FROM THE USE OF ANY MSCI INDEX OR ANY DATA INCLUDED THEREIN. NONE OF THE MSCI PARTIES SHALL HAVE ANY LIABILITY FOR ANY ERRORS, OMISSIONS OR INTERRUPTIONS OF OR IN CONNECTION WITH ANY MSCI INDEX OR ANY DATA INCLUDED THEREIN. FURTHER, NONE OF THE MSCI PARTIES MAKES ANY EXPRESS OR IMPLIED WARRANTIES OF ANY KIND, AND THE MSCI PARTIES HEREBY EXPRESSLY DISCLAIM ALL WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE, WITH RESPECT TO EACH MSCI INDEX AND ANY DATA INCLUDED THEREIN. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL ANY OF THE MSCI PARTIES HAVE ANY LIABILITY FOR ANY DIRECT, INDIRECT, SPECIAL, PUNITIVE, CONSEQUENTIAL OR ANY OTHER DAMAGES (INCLUDING LOST PROFITS) EVEN IF NOTIFIED OF THE POSSIBILITY OF SUCH DAMAGES.

## NASDAQ

ProShares Ultra, UltraPro, Short, UltraShort and UltraPro Short QQQ and ProShares Ultra and UltraShort Nasdaq Biotechnology (the “Nasdaq Funds”) are not sponsored, endorsed, sold or promoted by The NASDAQ OMX Group, Inc. or its affiliates or subsidiaries. (The NASDAQ OMX Group, Inc., collectively with its affiliates and subsidiaries, are referred to as “NASDAQ OMX”). NASDAQ OMX has not passed on the legality or suitability of, or the accuracy or adequacy of descriptions and disclosures relating to, the Nasdaq Funds. NASDAQ OMX makes no representation or warranty, express or implied, to the owners of the Nasdaq Funds or any member of the public regarding the advisability of investing in securities generally or in the Nasdaq Funds particularly. NASDAQ OMX has no liability in connection with the administration, marketing or trading of the Nasdaq Funds.

NASDAQ OMX does not guarantee the accuracy or completeness of the date on which the intraday portfolio value (the “IPV”) calculations are based or the actual computation of the value of the IPV, nor shall NASDAQ OMX be responsible for any delays in the computation or dissemination of the IPV. NASDAQ OMX makes no warranty, express or implied, as to results to be obtained by the Nasdaq Funds, or any other person or entity from the use of the IPV or any data included therein. NASDAQ OMX makes no express or implied warranties, and expressly disclaims all warranties of merchantability or fitness for a particular purpose or use with respect to the IPV or any data included therein. Without limiting any of the foregoing, in no event shall NASDAQ OMX have any liability for any lost profits or special, incidental, punitive, indirect, or consequential damages, even if notified of the possibility of such damages.

## ProShares UltraShort Oil & Gas Exploration & Production, ProShares Ultra Oil & Gas Exploration & Production

The S&P Oil & Gas Exploration & Production Select Industry Index (the “Index”) is equally weighted (as adjusted for diversification and liquidity) and includes domestic companies from the oil and gas exploration and production sub-industry. The Index includes domestic companies from the oil and gas exploration and production sub-industry. The Index is one of 25 S&P Select Sector Indexes (the “Select Industry Indices”), which are designed to measure the performance of a sub-industry or group of sub-industries determined based on the Global Industry Classification Standards (“GICS”). Companies in the Select Industry Indices are classified using the GICS classifications which are determined primarily based on a company’s revenues, however, earnings and market perception are also considered by GICS. The Index consists of constituents of the S&P Total Market Index (“S&P TMI”) that belong to the GICS oil & gas & production sub-industry that satisfy the following criteria: (1) have a float-adjusted market capitalization above \$500 million with a float-adjusted liquidity ratio (defined by dollar value traded over the previous 12 months divided by the float-adjusted market capitalization as of the Index rebalancing reference date) above 90% or have a float-adjusted market capitalization above

\$400 million with a float-adjusted liquidity ratio (as defined above) above 150%; and (2) are U.S. based companies. The market capitalization threshold may be relaxed to ensure that there are at least 22 stocks in the Index as of the rebalancing effective date. Rebalancing is done quarterly. The S&P TMI tracks all U.S. common stocks listed on the New York Stock Exchange (including the NYSE Arca, Inc. and NYSE Amex), the NASDAQ Global Select Market, the NASDAQ Select Market and the NASDAQ Capital Market.

## ProShares UltraPro Short Nasdaq Biotechnology and ProShares Ultra Nasdaq Biotechnology

ProShares UltraPro Short Nasdaq Biotechnology and ProShares UltraPro Nasdaq Biotechnology (the “Nasdaq Funds”) are not sponsored, endorsed, sold or promoted by The NASDAQ OMX Group, Inc. or its affiliates or subsidiaries. (The NASDAQ OMX Group, Inc., collectively with its affiliates and subsidiaries, are

referred to as “NASDAQ OMX”). NASDAQ OMX has not passed on the legality or suitability of, or the accuracy or adequacy of descriptions and disclosures relating to, the Nasdaq Funds. NASDAQ OMX makes no representation or warranty, express or implied, to the owners of the Nasdaq Funds or any member of the public regarding the advisability of investing in securities generally or in the Nasdaq Funds particularly. NASDAQ OMX has no liability in connection with the administration, marketing or trading of the Nasdaq Funds. NASDAQ OMX does not guarantee the accuracy or completeness of the date on which the intraday portfolio value (the “IPV”) calculations are based or the actual computation of the value of the IPV, nor shall NASDAQ OMX be responsible for any delays in the computation or dissemination of the IPV. NASDAQ OMX makes no warranty, express or implied, as to results to be obtained by the Nasdaq Funds, or any other person or entity from the use of the IPV or any data included therein. NASDAQ OMX makes no express or implied warranties, and expressly disclaims all warranties of merchantability or fitness for a particular purpose or use with respect to the IPV or any data included therein. Without limiting any of the foregoing, in no event shall NASDAQ OMX have any liability for any lost profits or special, incidental, punitive, indirect, or consequential damages, even if notified of the possibility of such damages.

#### **NYSE Group, Inc. (collectively, with its affiliates, “NYSE”)**

The NYSE Arca Gold Miners Index, a trademark of NYSE, is licensed for use by the Trust in connection with ProShares UltraShort Gold Miners or ProShares Ultra Gold Miners. NYSE neither sponsors nor endorses ProShares Trust, ProShares UltraShort Gold Miners or ProShares Ultra Gold Miners, and makes no warranty or representation as to the accuracy and/or completeness of the Index or results to be obtained by any person from using the Index in connection with trading ProShares UltraShort Gold Miners or ProShares Ultra Gold Miners.

THE SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND PROSHARES ULTRA GOLD MINERS ARE NOT SPONSORED, ENDORSED, SOLD OR PROMOTED BY NYSE. NYSE, AS INDEX COMPILATION AGENT (THE “INDEX COMPILATION AGENT”), MAKES NO REPRESENTATION OR WARRANTY, EXPRESS OR IMPLIED, TO THE OWNERS OF SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND PROSHARES ULTRA GOLD MINERS OR ANY MEMBER OF THE PUBLIC REGARDING THE ADVISABILITY OF INVESTING IN SECURITIES GENERALLY OR IN THE SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND PROSHARES ULTRA GOLD MINERS PARTICULARLY OR THE ABILITY OF THE INDEX IDENTIFIED HEREIN TO TRACK STOCK MARKET PERFORMANCE. NYSE IS THE LICENSOR OF CERTAIN TRADEMARKS, SERVICE MARKS AND TRADE NAMES, INCLUDING THE INDEX. THE INDEX IS DETERMINED, COMPOSED AND CALCULATED WITHOUT REGARD TO THE SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND PROSHARES ULTRA GOLD MINERS. THE INDEX COMPILATION AGENT IS NOT RESPONSIBLE FOR, NOR HAS IT PARTICIPATED IN, THE DETERMINATION OF THE TIMING OF, PRICES AT, OR QUANTITIES OF THE SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND

PROSHARES ULTRA GOLD MINERS TO BE ISSUED OR IN THE DETERMINATION OR CALCULATION OF THE EQUATION BY WHICH THE SHARES ARE REDEEMABLE. THE INDEX COMPILATION AGENT HAS NO OBLIGATION OR LIABILITY TO OWNERS OF SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND PROSHARES ULTRA GOLD MINERS IN CONNECTION WITH THE ADMINISTRATION, MARKETING OR TRADING OF THE SHARES OF PROSHARES ULTRASHORT GOLD MINERS AND PROSHARES ULTRA GOLD MINERS.

Although the Index Compilation Agent shall obtain information for inclusion in or for use in the calculation of the Index from sources which it considers reliable, the Index Compilation Agent does not guarantee the accuracy and/or the completeness of the component data of the Index obtained from independent sources. The Index Compilation Agent makes no warranty, express or implied, as to results to be obtained by the Trust as licensee, licensee’s customers and counterparties, owners of shares of ProShares UltraShort Gold Miners or ProShares Ultra Gold Miners, or any other person or entity from the use of the Index or any data included therein in connection with the rights licensed as described herein or for any other use. The Index Compilation Agent makes no express or implied warranties, and hereby expressly disclaims all warranties of merchantability or fitness for a particular purpose with respect to the Index or any data included therein. Without limiting any of the foregoing, in no event shall the Index Compilation Agent have any liability for any direct, indirect, special, punitive, consequential or any other damages (including lost profits) even if notified of an Index’s possibility of such damages.

#### **RAFI**

The RAFI™ US Equity Long/Short Index is calculated by S&P Dow Jones Indices LLC or its affiliates. S&P® is registered trademark of Standard & Poor’s Financial Services LLC (“S&P”) and Dow Jones® is a registered trademark of Dow Jones Trademark Holdings LLC (“Dow Jones”) and have been licensed for use by S&P Dow Jones Indices LLC and its affiliates. Investment products based on the RAFI™ US Equity Long/Short Index are not sponsored, endorsed, sold or promoted by S&P Dow Jones Indices LLC, Dow Jones, S&P or their respective affiliates and none of S&P Dow Jones Indices LLC, Dow Jones, S&P or their respective affiliates makes any representation regarding the advisability of investing in such product(s).

S&P Dow Jones Indices LLC, its affiliates, sources and distribution agents, and each of their respective officers, directors, employees, agents, representatives and licensors (collectively, the “Index Calculation Agent”) shall not be liable to ProShare Advisors, any customer or any third party for any loss or damage, direct, indirect or consequential, arising from (i) any inaccuracy or incompleteness in, or delays, interruptions, errors or omissions in the delivery of the RAFI™ US Equity Long/Short Index or any data related thereto (the “Index Data”) or (ii) any decision made or action taken by ProShare Advisors, any customer or third party in reliance upon the Index Data. The Index Calculation Agent does not make any warranties, express or implied, to ProShare Advisors, any of its customers or anyone else regarding the Index

Data, including, without limitation, any warranties with respect to the timeliness, sequence, accuracy, completeness, currentness, merchantability, quality or fitness for a particular purpose or any warranties as to the results to be obtained by ProShare Advisors, any of its customers or other person in connection with the use of the Index Data. The Index Calculation Agent shall not be liable to ProShare Advisors, its customers or other third parties for loss of business revenues, lost profits or any indirect, consequential, special or similar damages whatsoever, whether in contract, tort or otherwise, even if advised of the possibility of such damages.

Investors should be aware of the risks associated with data sources and quantitative processes used in our investment management process. Errors may exist in data acquired from third party vendors, the construction of model portfolios, and in coding related to the index and portfolio construction process. ## Russell

ProShares Russell 2000 Dividend Growers ETF, ProShares Ultra, UltraPro, Short, UltraShort and UltraPro Short Russell2000 (the “Russell Funds”) are not sponsored, endorsed, sold or promoted by Russell Investments (“Russell”). Russell does not make any representation or warranty, express or implied, to the owners of the Russell Funds or any member of the public regarding the advisability of investing in securities generally or in the Russell Funds particularly or the ability of the Russell indexes to track general stock market performance or a segment of the same. Russell’s publication of the Russell indexes in no way suggests or implies an opinion by Russell as to the advisability of investment in any or all of the securities upon which the Russell indexes are based. Russell’s only relationship to ProShares Trust is the licensing of certain trademarks and trade names of Russell, and is not responsible for and has not reviewed the Russell Funds nor any associated literature or publications and Russell makes no representation or warranty express or implied as to their accuracy or completeness, or otherwise. Russell reserves the right, at

any time and without notice, to alter, amend, terminate or in any way change the Russell indexes. Russell has no obligation or liability in connection with the administration, marketing or trading of the Russell Funds.

The Russell Funds (the “Fund”) are not in any way sponsored, endorsed, sold or promoted by the London Stock Exchange Group companies, which include FTSE International Limited (“FTSE”), Frank Russell Company (“Russell”), MTS Next Limited (“MTS”) and FTSE TMX Global Debt Capital Markets Inc (“FTSE TMX”) (together “LSEG”). LSEG makes no claim, prediction, warranty or representation whatsoever, expressly or impliedly, either as to (i) the results to be obtained from the use of the relevant Russell Index (upon which the Fund is based), (ii) the figure at which the index is said to stand at any particular time on any particular day or otherwise, or (iii) the suitability of the index for the purpose to which it is being put in connection with the Fund. LSEG has not provided nor will provide any financial or investment advice or recommendation in relation to the index to the adviser or to its clients. The index is calculated by FTSE or its agent. LSEG shall not be (a) liable (whether in negligence or otherwise) to any person for any error in the index or (b) under any obligation to advise any person of any error therein.

All rights in the index vest in FTSE. FTSE®, “Russell®”, “MTS®”, “FTSE TMX®” and “FTSE Russell” and other service marks and trademarks related to the FTSE or Russell indexes are trade marks of the London Stock Exchange Group companies and are used by FTSE, MTS, FTSE TMX and Russell under licence.

RUSSELL DOES NOT GUARANTEE THE ACCURACY AND/ OR THE COMPLETENESS OF THE RUSSELL INDEXES OR ANY DATA INCLUDED THEREIN AND RUSSELL SHALL HAVE NO LIABILITY FOR ANY ERRORS, OMISSIONS, OR INTERRUPTIONS THEREIN. RUSSELL MAKES NO WARRANTY, EXPRESS OR IMPLIED, AS TO RESULTS TO BE OBTAINED BY PROSHARES TRUST, INVESTORS, OWNERS OF THE RUSSELL FUNDS OR ANY OTHER PERSON OR ENTITY FROM THE USE OF THE RUSSELL INDEXES OR ANY DATA INCLUDED THEREIN. RUSSELL MAKES NO EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIM ALL WARRANTIES OR MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE WITH RESPECT TO THE RUSSELL INDEXES OR ANY DATA INCLUDED THEREIN. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT SHALL RUSSELL HAVE ANY LIABILITY FOR ANY SPECIAL, PUNITIVE, INDIRECT, OR CONSEQUENTIAL DAMAGES (INCLUDING LOST PROFITS), EVEN IF NOTIFIED OF THE POSSIBILITY OF SUCH DAMAGES.

## S&P Dow Jones Indices

“Standard & Poor’s®”, “S&P®”, “S&P500®”, “S&P MidCap 400®” and “Dividend Aristocrats®” are registered trademarks of Standard & Poor’s Financial Services LLC (“S&P”) and “Dow Jones®” is a registered trademark of Standard & Poor’s Financial Services LLC (“S&P”). The trademarks have been licensed to S&P Dow Jones Indices LLC and its affiliates. The indexes are a product of S&P Dow Jones Indices LLC and its affiliates. All have been licensed for use by ProShares. ProShares have not been passed on by S&P Dow Jones Indices LLC and its affiliates as to their legality or suit-

ability. ProShares based on the Indexes are not sponsored, endorsed, sold or promoted by S&P Dow Jones Indices LLC, Dow Jones, S&P, or any of their respective affiliates (collectively, "S&P Dow Jones Indices"). S&P Dow Jones Indices makes no representation or warranty, express or implied, to the owners of the Funds or any member of the public regarding the advisability of investing in securities generally or in the Funds particularly or the ability of the Indexes to track general market performance. S&P Dow Jones Indices' only relationship to ProShares with respect to the Indexes is the licensing of the Indexes and certain trademarks, service marks and/or trade names of S&P Dow Jones Indices and/or its third party licensors. The Indexes are determined, composed and calculated by S&P Dow Jones Indices without regard to ProShares or the Funds. S&P Dow Jones Indices has no obligation to take the needs of ProShares or the owners of the Funds into consideration in determining, composing or calculating the Indexes. S&P Dow Jones Indices is not responsible for and has not participated in the determination of the prices, and amount of the Funds or the timing of the issuance or sale of the Funds or in the determination or calculation of the equation by which the Funds are to be converted into cash. S&P Dow Jones Indices has no obligation or liability in connection with the administration, marketing or trading of the Funds. There is no assurance that investment products based on the Indexes will accurately track index performance or provide positive investment returns. S&P Dow Jones Indices LLC is not an investment advisor. Inclusion of a security within an index is not a recommendation by S&P Dow Jones Indices to buy, sell, or hold such security, nor is it considered to be investment advice.

S&P DOW JONES INDICES DOES NOT GUARANTEE THE ADEQUACY, ACCURACY, TIMELINESS AND/OR THE COMPLETENESS OF THE INDEXES OR ANY DATA RELATED THERETO OR ANY COMMUNICATION, INCLUDING BUT NOT LIMITED TO, ORAL OR WRITTEN COMMUNICATION (INCLUDING ELECTRONIC COMMUNICATIONS) WITH RESPECT THERETO. S&P DOW JONES INDICES SHALL NOT BE SUBJECT TO ANY DAMAGES OR LIABILITY FOR ANY ERRORS,

OMISSIONS, OR DELAYS THEREIN. S&P DOW JONES INDICES MAKES NO EXPRESS OR IMPLIED WARRANTIES, AND EXPRESSLY DISCLAIMS ALL WARRANTIES, OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE OR AS TO RESULTS TO BE OBTAINED BY PROSHARES, OWNERS OF THE FUNDS, OR ANY OTHER PERSON OR ENTITY FROM THE USE OF THE INDEXES OR WITH RESPECT TO ANY DATA RELATED THERETO. WITHOUT LIMITING ANY OF THE FOREGOING, IN NO EVENT WHATSOEVER SHALL S&P DOW JONES INDICES BE LIABLE FOR ANY INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES INCLUDING BUT NOT LIMITED TO, LOSS OF PROFITS, TRADING LOSSES, LOST TIME OR GOODWILL, EVEN IF THEY HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES, WHETHER IN CONTRACT, TORT, STRICT LIABILITY, OR OTHERWISE. THERE ARE NO THIRD PARTY BENEFICIARIES OF ANY AGREEMENTS OR ARRANGEMENTS BETWEEN S&P DOW JONES INDICES AND PROSHARES, OTHER THAN THE LICENSORS OF S&P DOW JONES INDICES.

### Solactive

"Solactive<sup>®</sup>" is a trademark of Solactive AG and has been licensed for use by ProShares. ProShares have not been passed on by Solactive AG as to their legality or suitability. ProShares based on the Solactive<sup>®</sup> Diversified USD Covered Bond Index are not sponsored, endorsed, sold or promoted by Solactive AG, and it makes no representation regarding the advisability of investing in ProShares. **THIS ENTITY AND ITS AFFILIATES MAKE NO WARRANTIES AND BEAR NO LIABILITY WITH RESPECT TO PROSHARES.**

### Portfolio Holdings Information

A description of the Trust's policies and procedures with respect to the disclosure of the Funds' portfolio holdings is available in the Funds' SAI. The top ten holdings of each Fund are posted on a daily basis to the Trust's website at ProShares.com.

# Management of ProShares Trust

## Board of Trustees and Officers

The Board is responsible for the general supervision of all of the Funds. The officers of the Trust are responsible for the day-to-day operations of the Funds.

## Investment Adviser

ProShare Advisors, located at 7501 Wisconsin Avenue, Suite 1000, Bethesda, Maryland 20814, serves as the investment adviser to all of the Funds and provides investment advice and management services to the Funds. ProShare Advisors oversees the investment and reinvestment of the assets in each Fund. For its investment advisory services, each Fund (other than ProShares Morningstar Alternatives Solution ETF, ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares S&P MidCap 400 Dividend Aristocrats ETF, ProShares Russell 2000 Dividend Growers ETF, ProShares S&P 500 Dividend Aristocrats ETF, ProShares MSCI EAFE Dividend Growers ETF, Hedged FTSE Europe ETF, Hedged FTSE Japan ETF, ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF, ProShares Short Term USD Emerging Markets Bond ETF, ProShares 30 Year TIPS/TSY Spread, ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF), pays ProShare Advisors a fee at an annualized rate based on its average daily net assets, of 0.75%. ProShare Advisors has entered into an Advisory Fee Waiver Agreement for each of these Funds that reduces the annualized rate based on its average daily net assets, as follows: 0.75% of the first \$4.0 billion of average daily net assets of the Fund; 0.70% of the average daily net assets of the Fund over \$4.0 billion to \$5.5 billion; 0.65% of the average daily net assets of the Fund over \$5.5 billion to \$7.0 billion; 0.60% of the average daily net assets of the Fund over \$7.0 billion to \$8.5 billion; and 0.55% of the average daily net assets of the Fund over \$8.5 billion. This fee waiver arrangement will remain in effect through at least September 30, 2017 and prior to such date ProShare Advisors may not terminate the arrangement without the approval of the Board.

For its investment advisory services, ProShares Morningstar Alternatives Solution ETF pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.07% of average daily net assets of the Fund. ProShares DJ Brookfield Global Infrastructure ETF pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.45%. ProShares Global Listed Private Equity ETF, ProShares MSCI EAFE Dividend Growers ETF, ProShares High Yield-Interest Rate Hedged and ProShares Short Term USD Emerging Markets Bond ETF each pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.50%. For its investment advisory services, each of ProShares S&P MidCap 400 Dividend Aristocrats ETF and ProShares Russell 2000 Dividend Growers ETF pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.40% of average daily net assets of the Fund. ProShares S&P 500 Dividend Aristocrats ETF, ProShares USD Covered Bond and ProShares German Sovereign/Sub-Sovereign ETF pays ProShare Advisors a fee at an annualized

rate based on its average daily net assets of 0.35%. ProShares Investment Grade-Interest Rate Hedged pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.30%. ProShares 30 Year TIPS/TSY Spread pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.55%. ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF each pays ProShare Advisors a fee at an annualized rate based on its average daily net assets of 0.65%. Pursuant to the Investment Advisory and Management Agreement between ProShare Advisors and the Trust (entered into on behalf of each of the Hedged FTSE Europe ETF and the Hedged FTSE Japan ETF), ProShare Advisors is responsible for substantially all expenses of each Fund, except interest expenses, taxes, brokerage and other transaction costs, compensation and expenses of the Independent Trustees, compensation and expenses of counsel to the Independent Trustees, compensation and expenses of the Trust's chief compliance officer and his or her staff, future distribution fees or expenses, and extraordinary expenses. For its investment advisory and management services, each of the Hedged FTSE Europe ETF and Hedged FTSE Japan ETF pays ProShare Advisors a fee at an annualized rate based on its respective average daily net assets of 0.23% of average daily net assets of the Hedged FTSE Japan ETF and 0.27% of average daily net assets of the Hedged FTSE Europe ETF.

A discussion regarding the basis for the Board approving the investment advisory agreement for each Fund, is in the Trust's most recent semi-annual report to shareholders dated November 30, 2014, or in the Trust's most recent annual report to shareholders dated May 31, 2015 or in the Trust's semi-annual or annual report to shareholders that covers the period during which the approval occurred.

## Portfolio Management

The following individuals have responsibility for the day-to-day management of the Funds as set forth in the Summary Prospectus relating to each Fund. The Portfolio Managers' business experience for the past five years is listed below. Additional information about the Portfolio Managers' compensation, other accounts managed by the Portfolio Managers and the Portfolio Managers' ownership of securities in the Fund can be found in the SAI.

**Alexander Ilyasov**, ProShare Advisors: Senior Portfolio Manager since October 2013 and Portfolio Manager from November 2009 through September 2013. ProFund Advisors LLC: Senior Portfolio Manager since October 2013 and Portfolio Manager from November 2009 through September 2013.

**Michael Neches**, ProShare Advisors: Senior Portfolio Manager since November 2010, Portfolio manager from January 2010 through October 2010 and Associate Portfolio Manager from January 2006 through December 2009. ProFunds Advisors LLC: Senior Portfolio Manager since October 2013 and from December 2010 through September 2011 and Portfolio Manager from December 2009 and through November 2010. ProShare Capital Management LLC: Senior Portfolio Manager from June 2012 through September 2013. World Asset Management: Portfolio Manager from January 2006 through November 2009.

**Jeffrey Ploshnick**, ProShare Advisors: Senior Portfolio Manager since March 2011. ProFund Advisors LLC: Senior Portfolio Manager since May 2007. ProShare Capital Management LLC: Senior Portfolio Manager since April 2011.

**Rachel Ames**, ProShare Advisors: Portfolio Manager since October 2013 and Associate Portfolio Manager from June 2009 through September 2013. ProFund Advisors LLC: Portfolio Manager since October 2013 and Associate Portfolio Manager from June 2009 through September 2013.

**Michelle Liu**, ProShare Advisors: Portfolio Manager since December 2009 and Associate Portfolio Manager from November 2007 through November 2009. ProFund Advisors LLC: Portfolio Manager since December 2009.

**Charles Lowery**, ProShare Advisors: Portfolio Manager since October 2013 and Associate Portfolio Manager from July 2010 through September 2013 and Portfolio Analyst from October 2006 through June 2010. ProFund Advisors LLC: Portfolio Manager since October 2013 and Associate Portfolio Manager from July 2010 through September 2013 and Portfolio Analyst from October 2006 through June 2010.

## Additional Information

The Trust enters into contractual arrangements with various parties, including, among others, the Advisor, administrator and fund accounting agent, custodian, transfer agent, and distributor, who provide services to the Funds. Shareholders are not parties to, or intended (or “third-party”) beneficiaries of, any of those contractual arrangements, and those contractual arrangements are not intended to create in any individual shareholder or group of shareholders any right to enforce them against the service providers or to seek any remedy under them against the service providers, either directly or on behalf of the Trust.

This Prospectus provides information concerning the Trust and the Funds that you should consider in determining whether to purchase shares of a Fund. None of this Prospectus, the SAI or any contract that is an exhibit to the Trust’s registration statement, is intended to, nor does it, give rise to an agreement or contract between the Trust or the Funds and any investor, or give rise to any contract or other rights in any individual shareholder, group of shareholders or other person than any rights conferred explicitly by federal or state securities laws that may not be waived.

## Determination of NAV

The NAV per share of each Fund is computed by dividing the value of the net assets of such Fund (i.e., the value of its total assets less total liabilities) by its total number of shares outstanding. Expenses and fees are accrued daily and taken into account for purposes of determining NAV. The NAV of each Fund is calculated by JPMorgan Chase Bank, National Association and, except for ProShares MSCI EAFE Dividend Growers ETF, ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares USD Covered Bond, ProShares German Sovereign/Sub-Sovereign ETF, ProShares Short Term USD Emerging Markets Bond ETF, ProShares 30 Year TIPS/TSY Spread, ProShares CDS North American HY Credit ETF, ProShares CDS Short North American HY Credit ETF, and certain of the Short Fixed Income and Ultra Fixed Income ProShares Funds as indicated

below, is generally determined each business day as of the close of regular trading on the Exchange on which it is listed (i.e., NYSE Arca, The NASDAQ Stock Market or the BATS Exchange) (ordinarily 4:00 p.m. Eastern Time). The NAV of ProShares High Yield-Interest Rate Hedged, ProShares Investment Grade-Interest Rate Hedged, ProShares USD Covered Bond, ProShares Short Term USD Emerging Markets Bond ETF, ProShares 30 Year TIPS/TSY Spread, ProShares CDS North American HY Credit ETF and ProShares CDS Short North American HY Credit ETF, and each of the Short Fixed Income ProShares Funds (except ProShares Short High Yield and ProShares Short Investment Grade Corporate) and Ultra Fixed Income ProShares Funds (except ProShares Ultra High Yield and ProShares Ultra Investment Grade Corporate) is generally determined at 3:00 p.m. (Eastern Time) each business day when the Exchange on which it is listed is open. The NAV of ProShares German Sovereign/Sub-Sovereign ETF is typically determined at 11:15 a.m. Eastern Time (this time may vary due to differences in when the daylight savings time is effective between London and New York. The actual valuation time is 4:15 p.m. London Time) each business day when NYSE Arca is open for trading. The NAV of each ProShares MSCI EAFE Dividend Growers ETF and ProShares Hedged FTSE Europe ETF is typically determined at 11:30 a.m. Eastern Time (this time may vary due to differences in when the daylight savings time is effective between London and New York. The actual valuation time is 4:30 p.m. London Time) each business day when NYSE Arca is open for trading. The NAV per share for ProShares Hedged FTSE Japan ETF is typically determined each business day at 11:00 a.m., Eastern Time on days when NYSE Arca is open for trading. (This time may vary due to differences in when daylight savings time is effective between London and New York time. The actual valuation time is 4:00 p.m. London Time.)

Securities and other assets are generally valued at their market value using information provided by a pricing service or market quotations. Certain short-term securities are valued on the basis of amortized cost. In addition, certain derivatives linked to an index may be valued based on the performance of one or more U.S. ETFs or instruments that reflect the values of the securities in such index, when the level of the index is not computed as of the close of the U.S. securities markets.

When a market price is not readily available, securities and other assets are valued at fair value in good faith under procedures established by, and under the general supervision and responsibility of, the Board. The use of a fair valuation method may be appropriate if, for example: (i) market quotations do not accurately reflect fair value of an investment; (ii) an investment’s value has been materially affected by events occurring after the close of the exchange or market on which the investment is principally traded (for example, a foreign exchange or market); (iii) a trading halt closes an exchange or market early; or (iv) other events result in an exchange or market delaying its normal close. This procedure incurs the unavoidable risk that the valuation may be higher or lower than the securities might actually command if the Funds sold them. See the SAI for more details.

ProShares DJ Brookfield Global Infrastructure ETF, ProShares Global Listed Private Equity ETF, ProShares MSCI EAFE Dividend

Growers ETF, ProShares MSCI Emerging Markets ETF, FTSE Europe ETF, the Hedged FTSE Japan ETF, ProShares German Sovereign/Sub-Sovereign ETF, ProShares Merger ETF, ProShares UltraShort Gold Miners, ProShares UltraShort Junior Miners, ProShares Ultra Gold Miners and ProShares Ultra Junior Miners contain portfolio investments that are primarily listed on foreign markets. To the extent a Fund's portfolio investments trade in foreign markets on days when a Fund is not open for business or when the primary exchange for the shares is not open, the value of the Fund's assets may vary, shareholders may not be able to purchase or sell Fund shares and Authorized Participants may not be able to create or redeem Creation Units. Also, certain portfolio investments may not be traded on days the Fund is open for business.

The NYSE Arca, The NASDAQ Stock Market and the BATS Exchange are open every week, Monday through Friday, except when the following holidays are celebrated: New Year's Day, Martin Luther King, Jr. Day (the third Monday in January), Presidents' Day (the third Monday in February), Good Friday, Memorial Day (the last Monday in May), Independence Day, Labor Day (the first Monday in September), Thanksgiving Day (the fourth Thursday in November) and Christmas Day. An Exchange may close early on the business day before each of these holidays and on the day after Thanksgiving Day. Exchange holiday schedules are subject to change without notice. If the exchange or market on which a Fund's investments are primarily traded closes early, the NAV may be calculated prior to its normal calculation time. Creation/redemption transaction order time cutoffs would also be accelerated.

## Distributions

As a shareholder on a Fund record date, you will earn a share of the investment income and net realized capital gains, if any, derived from a Fund's direct security holdings and derivative instruments. You will receive such earnings as either an income dividend or a capital gains distribution. Each Fund intends to declare and distribute net investment income, if any, and net realized capital gains, if any, to its shareholders at least annually. Subject to Board approval, some or all of any net realized capital gains distribution may be declared payable in either additional shares of the respective Fund or in cash.

If such a distribution is declared payable in that fashion, holders of shares will receive additional shares of the respective Fund unless they elect to receive cash. Distributions may be declared and paid more frequently to comply with the distribution requirements of the Internal Revenue Code or for other reasons.

## Dividend Reinvestment Services

As noted above under "Distributions", a Fund may declare a distribution from net realized capital gains to be payable in additional shares or cash. Even if the Fund does not declare a distribution to be payable in shares, brokers may make available to their customers who own shares the DTC book-entry dividend reinvestment service. If this service is available and used, dividend distributions of both income and capital gains will automatically be reinvested in additional whole shares of the same Fund. Without this service,

investors would have to take their distributions in cash. To determine whether the dividend reinvestment service is available and whether there is a commission or other charge for using this service, please consult your broker.

## Frequent Purchases and Redemptions of Shares

The Board has not adopted a policy of monitoring for frequent purchases and redemptions of shares that appear to attempt to take advantage of potential arbitrage opportunities. The Board believes this is appropriate because ETFs, such as the Funds, are intended to be attractive to arbitrageurs, as trading activity is critical to ensuring that the market price of shares remains at or close to NAV.

## Taxes

The following is certain general information about taxation of the Funds:

- Each Fund intends to qualify for treatment as a "regulated investment company" for U.S. federal income tax purposes. In order to so qualify, each Fund must meet certain tests with respect to the sources and types of its income, the nature and diversification of its assets, and the timing and amount of its distributions.
- If a Fund qualifies for treatment as a regulated investment company, it is not subject to federal income tax on net investment income and net realized capital gains that the Fund timely distributes to its shareholders. If a Fund were to fail to so qualify, and were ineligible to or otherwise did not cure such failure, its taxable income and gains would be subject to tax at the Fund level, and distributions from earnings and profits would be taxable to shareholders as ordinary income.
- Investments by a Fund in options, futures, forward contracts, swap agreements and other derivative financial instruments are subject to numerous special and complex tax rules. These rules could affect the amount, timing or character of the distributions to shareholders by a Fund. In addition, because the application of these rules may be uncertain under current law, an adverse determination or future Internal Revenue Service guidance with respect to these rules may affect whether a Fund has made sufficient distributions, and otherwise satisfied the relevant requirements, to maintain its qualification as a regulated investment company and avoid fund-level tax.
- Investments by a Fund in debt obligations issued or purchased at a discount and certain derivative instruments could cause a Fund to recognize taxable income in excess of the cash generated by such investments, potentially requiring the Fund to dispose of investments (including when otherwise disadvantageous to do so) in order to meet its distribution requirements, and such investments could affect the amount, timing or character of the income distributed to shareholders by a Fund. Investments by a Fund in shares of other investment companies could affect the amount, timing or character of the Fund's distributions to shareholders relative to the Fund's distributions had it invested directly in the securities held by the other investment companies.

- A Fund's ability to pursue its investment strategies may be limited by a Fund's intention to qualify as a regulated investment company for tax purposes, and may bear adversely on a Fund's ability to so qualify. For these purposes, a Fund is limited to investing no more than 25% of the value of its total assets in securities of one or more "qualified publicly traded partnerships" (QPTPs). If a Fund does not appropriately limit such investment, a Fund's status as a regulated investment company will be jeopardized. If, in any year, a Fund were to fail to qualify as a regulated investment company, that Fund would be taxed as an ordinary corporation subject to U.S. federal income tax on all its income at the fund level. The resulting taxes could substantially reduce such Fund's net assets and the amount of income available for distribution.

Taxable investors should be aware of the following basic tax points:

- Distributions are taxable to you for federal income tax purposes whether you receive them in cash or reinvest them in additional shares.
- Distributions declared in October, November or December of one year payable to shareholders of record in such month and paid by the end of January of the following year—are taxable for federal income tax purposes as if received on December 31 of the calendar year in which the distributions were declared.
- Any distributions from income or short-term capital gains that you receive generally are taxable to you as ordinary dividends for federal income tax purposes. Ordinary dividends you receive that a Fund reports as "qualified dividend income" may be taxed at the same rates as long-term capital gains, but will not be considered long-term capital gains for other federal income tax purposes, including the calculation of net capital losses.
- Any distributions of net long-term capital gains are taxable to you for federal income tax purposes as long-term capital gains includible in net capital gain and taxable to individuals at reduced rates, no matter how long you have owned your Fund shares.
- Distributions from net realized capital gains may vary considerably from year to year as a result of the Fund's normal investment activities and cash flows.
- The Code generally imposes a 3.8% Medicare contribution tax on the "net investment income" of certain individuals, trusts and estates to the extent their income exceeds certain threshold amounts. For these purposes, "net investment income" generally includes, among other things, (i) distributions paid by a Fund of ordinary dividends and capital gain dividends, and (ii) any net gain from the sale, redemption or exchange of Fund shares. Shareholders are advised to consult their tax advisors regarding the possible implications of this additional tax on their investment in a Fund.
- A sale or exchange of Fund shares is a taxable event. This means that you may have a capital gain to report as income, or a capital loss to report as a deduction, when you complete your federal income tax return.
- Dividend and capital gain distributions that you receive, as well as your gains or losses from any sale or exchange of Fund shares, may be subject to state and local income taxes.
- If you are not a citizen or permanent resident of the United States, or if you are a foreign entity, any dividends and short-term capital gain distributions that you receive will generally be subject to a 30% U.S. withholding tax, unless a lower treaty rate or a statutory exemption applies.
- A Fund's income from or the proceeds of dispositions of its non-U.S. investments may be subject to withholding and other taxes imposed by foreign countries, which will reduce the Fund's return on and taxable distributions in respect of its non-U.S. investments. Tax conventions between certain countries and the United States may reduce or eliminate these taxes. If more than 50% of the value of a Fund's total assets at the close of a taxable year consists of securities of foreign corporations, the Fund will be eligible to elect to "pass through" to you foreign income taxes that it has paid. If this election is made, you will be required to include your share of those taxes in gross income as a distribution from the Fund and you generally will be allowed to claim a credit (or a deduction, if you itemize deductions) for these amounts on your federal U.S. income tax return, subject to certain limitations.
- By law, a percentage of your distributions and proceeds will generally be withheld if you have not provided a taxpayer identification number or social security number, have under-reported dividend or interest income or have failed to certify to a Fund or its agent that you are not subject to this withholding. The backup withholding rate is 28%.

In addition, taxable investors who purchase or redeem Creation Units should be aware of the following:

- A person who exchanges securities for Creation Units generally will recognize a gain or loss equal to the difference between the market value of the Creation Units at the time of the exchange and the exchanger's aggregate basis in the securities surrendered and any cash amount paid.
- A person who exchanges Creation Units for securities generally will recognize a gain or loss equal to the difference between the exchanger's basis in the Creation Units and the aggregate market value of the securities received and any cash received. However, all or a portion of any loss a person realizes upon an exchange of Creation Units for securities will be disallowed by the Internal Revenue Service if such person purchases other substantially identical shares of the Fund within 30 days before or after the exchange. In such case, the basis of the newly purchased shares will be adjusted to reflect the disallowed loss.

Note: This Prospectus provides general U.S. federal income tax information only. Your investment in the Fund may have other tax implications. If you are investing through a tax-deferred retirement account, such as an individual retirement account (IRA), special tax rules apply. Please consult your tax advisor for detailed information about a Fund's tax consequences for you. See "Taxation" in the SAI for more information.

**Premium/Discount Information**

The Trust's website has information about the premiums and discounts for each of the Funds. Premiums or discounts are the differences between the NAV and market price of a Fund on a given day, generally at the time NAV is calculated. A premium is the amount that a Fund is trading above the NAV. A discount is the amount that a Fund is trading below the NAV.

**Escheatment**

Unclaimed or inactive accounts may be subject to escheatment laws, and each Fund and each Fund's transfer agent will not be liable to shareholders and their representatives for good faith compliance with those laws.

**Distribution (12b-1) Plan**

Under a Rule 12b-1 Distribution Plan (the "Plan") adopted by the Board, each Fund may pay the Funds' distributor and financial intermediaries, such as broker-dealers and investment advisors, up to 0.25% on an annualized basis of the average daily net assets of a Fund as reimbursement or compensation for distribution related activities with respect to the Funds. Because these fees would be paid out of each Fund's assets on an on-going basis, over time these fees would increase the cost of your investment and may cost you more than paying other types of sales charges. For the prior fiscal year, no payments were made by any Fund under the Plan.

# Financial Highlights

The following tables are intended to help you understand the financial history of each Fund for the past five years (or since inception, if shorter). The tables may include information about funds that were previously, but are no longer, publicly offered by the Trust. Certain information reflects financial results of a single share. The total return information represents the rate of return and the per share operating performance that an investor would have earned (or lost) on an investment in a Fund, assuming reinvestment of all dividends and distributions. This information has been audited by PricewaterhouseCoopers LLP, an independent registered public accounting firm, whose report, along with the financial statements of the Funds, appears in the Annual Report of the Funds and is available upon request.

## ProShares Trust Notes to Financial Highlights:

- (a) Per share net investment income (loss) has been calculated using the average daily shares method.
- (b) Includes transaction fees associated with the issuance and redemption of Creation Units.
- (c) Not annualized for periods less than one year.
- (d) Net asset value total return is calculated assuming an initial investment made at the net asset value at the beginning of the period, reinvestment of all dividends and distributions at net asset value during the period, if any, and redemption on the last day of the period at net asset value. This percentage is not an indication of the performance of a shareholder's investment in the Fund based on market value due to differences between the market price of the shares and the net asset value per share of the Fund.
- (e) Market value total return is calculated assuming an initial investment made at the market value at the beginning of the period, reinvestment of all dividends and distributions at net asset value during the period, if any, and redemption on the last day of the period at market value. Market value is determined by the composite closing price. Composite closing security price is defined as the last reported sale price from any primary listing market (e.g., NYSE and NASDAQ) or participating regional exchanges or markets. The composite closing price is the last reported sale price from any of the eligible sources, regardless of volume and not an average price and may have occurred on a date prior to the close of the reporting period. Market value may be greater or less than net asset value, depending on the Fund's closing price on the listing market.
- (f) Annualized for periods less than one year.
- (g) Portfolio turnover rate is calculated without regard to instruments having a maturity of less than one year from acquisition or derivative instruments (including swap agreements and futures contracts). The portfolio turnover rate can be high and volatile due to the sales and purchases of fund shares during the period. In-Kind transactions are not included in the portfolio turnover calculations.
- (h) Per share amount is less than \$0.005.
- (i) The amount shown for a share outstanding throughout the period is not in accordance with the aggregate net realized and unrealized gain (loss) for that period because of the timing of sales and repurchases of the Fund shares in relation to fluctuating market value of the investments in the Fund.
- (j) Less than 0.5%.
- (k) Less than 0.005%.
- (l) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective February 25, 2011.
- (m) Per share amounts have been restated on a retroactive basis to reflect a 1:5 reverse stock split effective February 25, 2011.
- (n) Per share amounts have been restated on a retroactive basis to reflect a 2:1 stock split effective February 25, 2011.
- (o) Per share amounts have been restated on a retroactive basis to reflect a 3:1 stock split effective February 25, 2011.
- (p) Per share amounts have been restated on a retroactive basis to reflect a 1:3 reverse stock split effective October 13, 2011.
- (q) Per share amounts have been restated on a retroactive basis to reflect a 2:1 stock split effective May 11, 2012.
- (r) Per share amounts have been restated on a retroactive basis to reflect a 3:1 stock split effective May 11, 2012.
- (s) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective May 11, 2012.
- (t) Per share amounts have been restated on a retroactive basis to reflect a 1:5 reverse stock split effective May 11, 2012.
- (u) Per share amounts have been restated on a retroactive basis to reflect a 2:1 stock split effective October 5, 2012.
- (v) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective October 5, 2012.
- (w) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective June 10, 2013.
- (x) Per share amounts have been restated on a retroactive basis to reflect a 2:1 stock split effective June 10, 2013.
- (y) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective January 24, 2014.
- (z) Per share amounts have been restated on a retroactive basis to reflect a 2:1 stock split effective January 24, 2014.
- (aa) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective November 6, 2014.
- (bb) Per share amounts have been restated on a retroactive basis to reflect a 1:5 reverse stock split effective November 6, 2014.
- (cc) Per share amounts have been restated on a retroactive basis to reflect a 1:4 reverse stock split effective May 20, 2015.
- (dd) Per share amounts have been restated on a retroactive basis to reflect a 2:1 stock split effective May 20, 2015.
